16  
17  
18 Status of this Memo

19 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026]. Internet-Drafts are  
20 working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may  
21 also distribute working documents as Internet-Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other  
23 documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in  
24 progress".

25 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

26 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

27 Abstract

28 This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is  
29 an application level protocol that can be used for distributed printing using Internet tools and technologies. This document  
30 defines the rules for encoding IPP operations and IPP attributes into a new Internet mime media type called "application/ipp".  
31 This document also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This  
32 document defines a new scheme named 'ipp' for identifying IPP printers and jobs.

33 The full set of IPP documents includes:

- 34 Design Goals for an Internet Printing Protocol [RFC2567]
- 35 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]
- 36 Internet Printing Protocol/1.1: Model and Semantics [ipp-mod]
- 37 Internet Printing Protocol/1.1: Encoding and Transport (this document)
- 38 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]
- 39 Mapping between LPD and IPP Protocols [RFC2569]

40 The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed printing functionality, and it  
41 enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It  
42 identifies requirements for three types of users: end users, operators, and administrators. It calls out a subset of end user  
43 requirements that are satisfied in IPP/1.1. A few OPTIONAL operator operations have been added to IPP/1.1.

44 The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol", describes IPP from a high  
45 level view, defines a roadmap for the various documents that form the suite of IPP specification documents, and gives  
46 background and rationale for the IETF working group's major decisions.

47 The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model with abstract objects, their  
48 attributes, and their operations that are independent of encoding and transport. It introduces a Printer and a Job object. The Job  
49 object optionally supports multiple documents per Job. It also addresses security, internationalization, and directory issues.

50 The document "Internet Printing Protocol/1.1: Implementer's Guide", gives advice to implementers of IPP clients and IPP  
51 objects.

52 The document "Mapping between LPD and IPP Protocols" gives some advice to implementers of gateways between IPP and  
53 LPD (Line Printer Daemon) implementations.

## 100 **1. Introduction**

101 This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation  
102 layer.

103 The transport layer consists of an HTTP/1.1 request or response. RFC 2616 [RFC2616] describes HTTP/1.1. This document  
104 specifies the HTTP headers that an IPP implementation supports.

105 The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing Protocol/1.1:  
106 Model and Semantics" [ipp-mod] defines the semantics of such a message body and the supported values. This document  
107 specifies the encoding of an IPP operation. The aforementioned document [ipp-mod] is henceforth referred to as the "IPP model  
108 document"

## 109 **2. Conformance Terminology**

110 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and  
111 "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

## 112 **3. Encoding of the Operation Layer**

113 The operation layer MUST contain a single operation request or operation response. Each request or response consists of a  
114 sequence of values and attribute groups. Attribute groups consist of a sequence of attributes each of which is a name and value.  
115 Names and values are ultimately sequences of octets

116 The encoding consists of octets as the most primitive type. There are several types built from octets, but three important types are  
117 integers, character strings and octet strings, on which most other data types are built. Every character string in this encoding  
118 MUST be a sequence of characters where the characters are associated with some charset and some natural language. A character  
119 string MUST be in "reading order" with the first character in the value (according to reading order) being the first character in  
120 the encoding. A character string whose associated charset is US-ASCII whose associated natural language is US English is  
121 henceforth called a US-ASCII-STRING. A character string whose associated charset and natural language are specified in a  
122 request or response as described in the model document is henceforth called a LOCALIZED-STRING. An octet string MUST be  
123 in "IPP model document order" with the first octet in the value (according to the IPP model document order) being the first octet  
124 in the encoding. Every integer in this encoding MUST be encoded as a signed integer using two's-complement binary encoding  
125 with big-endian format (also known as "network order" and "most significant byte first"). The number of octets for an integer  
126 MUST be 1, 2 or 4, depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are used for  
127 the version-number and tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation-id,  
128 status-code and length fields. Four byte integers, henceforth called SIGNED-INTEGER, are used for values fields and the  
129 sequence number.

130 The following two sections present the operation layer in two ways

- 131 - informally through pictures and description
- 132 - formally through Augmented Backus-Naur Form (ABNF), as specified by RFC 2234 [RFC2234]

133

134 **3.1 Picture of the Encoding**

135 The encoding for an operation request or response consists of:

136	-----		
137		version-number	2 bytes - required
138	-----		
139		operation-id (request)	2 bytes - required
140		or	
141		status-code (response)	
142	-----		
143		request-id	4 bytes - required
144	-----		
145		xxx-attributes-tag	1 byte   -0 or more
146	-----		
147		xxx-attribute-sequence	n bytes
148	-----		
149		end-of-attributes-tag	1 byte - required
150	-----		
151		data	q bytes - optional
152	-----		

153 The xxx-attributes-tag and xxx-attribute-sequence represents four different values of "xxx", namely, operation, job, printer and  
 154 unsupported. The xxx-attributes-tag and an xxx-attribute-sequence represent attribute groups in the model document. The xxx-  
 155 attributes-tag identifies the attribute group and the xxx-attribute-sequence contains the attributes.

156 The expected sequence of xxx-attributes-tag and xxx-attribute-sequence is specified in the IPP model document for each  
 157 operation request and operation response.

158 A request or response SHOULD contain each xxx-attributes-tag defined for that request or response even if there are no attributes  
 159 except for the unsupported-attributes-tag which SHOULD be present only if the unsupported-attribute-sequence is non-empty. A  
 160 receiver of a request MUST be able to process as equivalent empty attribute groups:

- 161 a) an xxx-attributes-tag with an empty xxx-attribute-sequence,
- 162 b) an expected but missing xxx-attributes-tag.

163 The data is omitted from some operations, but the end-of-attributes-tag is present even when the data is omitted. Note, the xxx-  
 164 attributes-tags and end-of-attributes-tag are called 'delimiter-tags'. Note: the xxx-attribute-sequence, shown above may consist of  
 165 0 bytes, according to the rule below.

166 An xxx-attributes-sequence consists of zero or more compound-attributes.

167	-----		
168		compound-attribute	s bytes - 0 or more
169	-----		

170 A compound-attribute consists of an attribute with a single value followed by zero or more additional values.

171 Note: a 'compound-attribute' represents a single attribute in the model document. The 'additional value' syntax is for attributes  
 172 with 2 or more values.

173 Each attribute consists of:

174	-----		
175		value-tag	1 byte
176	-----		
177		name-length (value is u)	2 bytes
178	-----		
179		name	u bytes
180	-----		
181		value-length (value is v)	2 bytes
182	-----		
183		value	v bytes
184	-----		

185 An additional value consists of:

186	-----		
187		value-tag	1 byte
188	-----		
189		name-length (value is 0x0000)	2 bytes
190	-----		
191		value-length (value is w)	2 bytes
192	-----		
193		value	w bytes
194	-----		

-0 or more

195  
196 Note: an additional value is like an attribute whose name-length is 0.

197 From the standpoint of a parsing loop, the encoding consists of:

198	-----		
199		version-number	2 bytes - required
200	-----		
201		operation-id (request)	2 bytes - required
202		or	
203		status-code (response)	
204	-----		
205		request-id	4 bytes - required
206	-----		
207		tag (delimiter-tag or value-tag)	1 byte
208	-----		
209		empty or rest of attribute	x bytes
210	-----		
211		end-of-attributes-tag	2 bytes - required
212	-----		
213		data	y bytes - optional
214	-----		
215			

-0 or more

216 The value of the tag determines whether the bytes following the tag are:

- 217 - attributes
- 218 - data
- 219 - the remainder of a single attribute where the tag specifies the type of the value.

## 220 3.2 Syntax of Encoding

221 The syntax below is ABNF [RFC2234] except 'strings of literals' MUST be case sensitive. For example 'a' means lower case 'a'  
 222 and not upper case 'A'. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as '%x' values which show  
 223 their range of values.

```

224 ipp-message = ipp-request / ipp-response
225 ipp-request = version-number operation-id request-id
226             *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
227 ipp-response = version-number status-code request-id
228             *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
229 xxx-attribute-sequence = *compound-attribute
230
231 xxx-attributes-tag = operation-attributes-tag / job-attributes-tag /
232                   printer-attributes-tag / unsupported-attributes-tag
233
234 version-number = major-version-number minor-version-number
235 major-version-number = SIGNED-BYTE ; initially %d1
236 minor-version-number = SIGNED-BYTE ; initially %d0
237
238 operation-id = SIGNED-SHORT ; mapping from model defined below
239 status-code = SIGNED-SHORT ; mapping from model defined below
240 request-id = SIGNED-INTEGER ; whose value is > 0
241
242 compound-attribute = attribute *additional-values
243
244 attribute = value-tag name-length name value-length value
245 additional-values = value-tag zero-name-length value-length value
246
247 name-length = SIGNED-SHORT ; number of octets of 'name'
248 name = LALPHA *( LALPHA / DIGIT / "-" / "_" / "." )
249 value-length = SIGNED-SHORT ; number of octets of 'value'
250 value = OCTET-STRING
251
252 data = OCTET-STRING
253
254 zero-name-length = %x00.00 ; name-length of 0
255 operation-attributes-tag = %x01 ; tag of 1
256 job-attributes-tag = %x02 ; tag of 2
257 printer-attributes-tag = %x04 ; tag of 4
258 unsupported- attributes-tag = %x05 ; tag of 5
259 end-of-attributes-tag = %x03 ; tag of 3
260 value-tag = %x10-FF
261
262 SIGNED-BYTE = BYTE
263 SIGNED-SHORT = 2BYTE
264 SIGNED-INTEGER = 4BYTE
265 DIGIT = %x30-39 ; "0" to "9"
266 LALPHA = %x61-7A ; "a" to "z"
267 BYTE = %x00-FF
268 OCTET-STRING = *BYTE
269

```

270 The syntax allows an xxx-attributes-tag to be present when the xxx-attribute-sequence that follows is empty. The syntax is  
 271 defined this way to allow for the response of Get-Jobs where no attributes are returned for some job-objects. Although it is

272 RECOMMENDED that the sender not send an xxx-attributes-tag if there are no attributes (except in the Get-Jobs response just  
273 mentioned), the receiver MUST be able to decode such syntax.

### 274 3.3 Version-number

275 The version-number MUST consist of a major and minor version-number, each of which MUST be represented by a SIGNED-  
276 BYTE. The protocol described in this document MUST have a major version-number of 1 (0x01) and a minor version-number of  
277 1 (0x01). The ABNF for these two bytes MUST be %x01.01.

### 278 3.4 Operation-id

279 Operation-ids are defined as enums in the model document. An operation-ids enum value MUST be encoded as a SIGNED-  
280 SHORT.

### 281 3.5 Status-code

282 Status-codes are defined as enums in the model document. A status-code enum value MUST be encoded as a SIGNED-SHORT.

283 The status-code is an operation attribute in the model document. In the protocol, the status-code is in a special position, outside of  
284 the operation attributes.

285 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (successful-ok). With any other HTTP Status-Code  
286 value, the HTTP response MUST NOT contain an IPP message-body, and thus no IPP status-code is returned.

### 287 3.6 Request-id

288 The request-id allows a client to match a response with a request. This mechanism is unnecessary in HTTP, but may be useful  
289 when application/ipp entity bodies are used in another context.

290 The request-id in a response MUST be the value of the request-id received in the corresponding request. A client can set the  
291 request-id in each request to a unique value or a constant value, such as 1, depending on what the client does with the request-id  
292 returned in the response. The value of the request-id MUST be greater than zero.

### 293 3.7 Tags

294 There are two kinds of tags:

- 295 - delimiter tags: delimit major sections of the protocol, namely attributes and data
- 296 - value tags: specify the type of each attribute value

#### 297 3.7.1 Delimiter Tags

298 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	Delimiter
0x00	reserved for definition in a future IETF standards track document
0x01	operation-attributes-tag
0x02	job-attributes-tag
0x03	end-of-attributes-tag
0x04	printer-attributes-tag
0x05	unsupported-attributes-tag
0x06-0x0e	reserved for future delimiters in IETF standards track documents
0x0F	reserved for future chunking-end-of-attributes-tag for definition in a future IETF standards track document

299 When an xxx-attributes-tag occurs in the protocol, it MUST mean that zero or more following attributes up to the next delimiter  
300 tag are attributes belonging to group xxx as defined in the model document, where xxx is operation, job, printer, unsupported.

301 Doing substitution for xxx in the above paragraph, this means the following. When an operation-attributes-tag occurs in the  
302 protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are operation attributes as defined  
303 in the model document. When an job-attributes-tag occurs in the protocol, it MUST mean that the zero or more following  
304 attributes up to the next delimiter tag are job attributes or job template attributes as defined in the model document. When a  
305 printer-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag  
306 are printer attributes as defined in the model document. When an unsupported-attributes-tag occurs in the protocol, it MUST  
307 mean that the zero or more following attributes up to the next delimiter tag are unsupported attributes as defined in the model  
308 document.

309 The operation-attributes-tag and end-of-attributes-tag MUST each occur exactly once in an operation. The operation-attributes-  
310 tag MUST be the first tag delimiter, and the end-of-attributes-tag MUST be the last tag delimiter. If the operation has a  
311 document-content group, the document data in that group MUST follow the end-of-attributes-tag.

312 Each of the other three xxx-attributes-tags defined above is OPTIONAL in an operation and each MUST occur at most once in  
313 an operation, except for job-attributes-tag in a Get-Jobs response which may occur zero or more times.

314 The order and presence of delimiter tags for each operation request and each operation response MUST be that defined in the  
315 model document. For further details, see section 3.9 "(Attribute) Name" and 13 "Appendix A: Protocol Examples".

316 A Printer MUST treat the reserved delimiter tags differently from reserved value tags so that the Printer knows that there is an  
317 entire attribute group that it doesn't understand as opposed to a single value that it doesn't understand.

### 318 3.7.2 Value Tags

319 The remaining tables show values for the value-tag, which is the first octet of an attribute. The value-tag specifies the type of the  
320 value of the attribute. The following table specifies the "out-of-band" values for the value-tag.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	reserved for 'default' for definition in a future IETF standards track document
0x12	unknown
0x13	no-value
0x14-0x1F	reserved for "out-of-band" values in future IETF standards track documents.

321 The "unsupported" value MUST be used in the attribute-sequence of an error response for those attributes which the printer does  
322 not support. The "default" value is reserved for future use of setting value back to their default value. The "unknown" value is  
323 used for the value of a supported attribute when its value is temporarily unknown. The "no-value" value is used for a supported

324 attribute to which no value has been assigned, e.g. "job-k-octets-supported" has no value if an implementation supports this  
 325 attribute, but an administrator has not configured the printer to have a limit.

326 The following table specifies the integer values for the value-tag:

<b>Tag Value (Hex)</b>	<b>Meaning</b>
0x20	reserved for definition in a future IETF standards track document
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for integer types for definition in future IETF standards track documents

327 NOTE: 0x20 is reserved for "generic integer" if it should ever be needed.

328 The following table specifies the octetString values for the value-tag:

<b>Tag Value (Hex)</b>	<b>Meaning</b>
0x30	octetString with an unspecified format
0x31	dateTime
0x32	resolution
0x33	rangeOfInteger
0x34	reserved for definition in a future IETF standards track document
0x35	textWithLanguage
0x36	nameWithLanguage
0x37-0x3F	reserved for octetString type definitions in future IETF standards track documents

329 The following table specifies the character-string values for the value-tag:

<b>Tag Value (Hex)</b>	<b>Meaning</b>
0x40	reserved for definition in a future IETF standards track document
0x41	textWithoutLanguage
0x42	nameWithoutLanguage
0x43	reserved for definition in a future IETF standards track document
0x44	keyword
0x45	uri
0x46	uriScheme
0x47	charset
0x48	naturalLanguage
0x49	mimeMediaType
0x4A-0x5F	reserved for character string type definitions in future IETF standards track documents

330 NOTE: 0x40 is reserved for "generic character-string" if it should ever be needed.

331 NOTE: an attribute value always has a type, which is explicitly specified by its tag; one such tag value is  
 332 "nameWithoutLanguage". An attribute's name has an implicit type, which is keyword.

333 The values 0x60-0xFF are reserved for future definitions in IETF standards track documents.

334 The tag 0x7F is reserved for extending types beyond the 255 values available with a single byte. A tag value of 0x7F MUST  
 335 signify that the first 4 bytes of the value field are interpreted as the tag value. Note, this future extension doesn't affect parsers

336 that are unaware of this special tag. The tag is like any other unknown tag, and the value length specifies the length of a value  
337 which contains a value that the parser treats atomically. Values from 0x00 to 0x37777777 are reserved for definition in future  
338 IETF standard track documents. The values 0x40000000 to 0x7FFFFFFF are reserved for vendor extensions.

### 339 3.8 Name-Length

340 The name-length field **MUST** consist of a SIGNED-SHORT. This field **MUST** specify the number of octets in the name field  
341 which follows the name-length field, excluding the two bytes of the name-length field.

342 If a name-length field has a value of zero, the following name field **MUST** be empty, and the following value **MUST** be treated as  
343 an additional value for the preceding attribute. Within an attribute-sequence, if two or more attributes have the same name, the  
344 attribute-sequence is mal-formed (see [ipp-mod] section 3.1.3). The zero-length name is the only mechanism for multi-valued  
345 attributes.

### 346 3.9 (Attribute) Name

347 Some operation elements are called parameters in the model document [ipp-mod]. They **MUST** be encoded in a special position  
348 and they **MUST NOT** appear as operation attributes. These parameters are:

- 349 - "version-number": The parameter named "version-number" in the IPP model document **MUST** become the "version-  
350 number" field in the operation layer request or response.
- 351 - "operation-id": The parameter named "operation-id" in the IPP model document **MUST** become the "operation-id" field  
352 in the operation layer request.
- 353 - "status-code": The parameter named "status-code" in the IPP model document **MUST** become the "status-code" field in  
354 the operation layer response.
- 355 - "request-id": The parameter named "request-id" in the IPP model document **MUST** become the "request-id" field in the  
356 operation layer request or response.  
357

358 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they can be persistently and  
359 unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more stable (i.e.,  
360 defined more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually be URLs  
361 [RFC1738] [RFC1808]. Since every URL is a specialized form of a URI, even though the more generic term URI is used  
362 throughout the rest of this document, its usage is intended to cover the more specific notion of URL as well.

363 Some operation elements are encoded twice, once as the request-URI on the HTTP Request-Line and a second time as a  
364 **REQUIRED** operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called  
365 printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs  
366 **NEED NOT** be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to  
367 generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP  
368 server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the  
369 mapping of IPP onto HTTP/1.1:

- 370 1. Although potentially redundant, a client **MUST** supply the target of the operation both as an operation attribute and as a  
371 URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping  
372 application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in  
373 the transport layer.

- 374 2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they MUST  
 375 both reference the same IPP object.  
 376 3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to the  
 377 correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation  
 378 request.  
 379 4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP  
 380 Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI  
 381 within the operation request; the choice is up to the implementation.  
 382 5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.

383 The model document arranges the remaining attributes into groups for each operation request and response. Each such group  
 384 MUST be represented in the protocol by an xxx-attribute-sequence preceded by the appropriate xxx-attributes-tag (See the table  
 385 below and section 13 "Appendix A: Protocol Examples"). In addition, the order of these xxx-attributes-tags and xxx-attribute-  
 386 sequences in the protocol MUST be the same as in the model document, but the order of attributes within each xxx-attribute-  
 387 sequence MUST be unspecified. The table below maps the model document group name to xxx-attributes-sequence:

<b>Model Document Group</b>	<b>xxx-attributes-sequence</b>
Operation Attributes	operations-attributes-sequence
Job Template Attributes	job-attributes-sequence
Job Object Attributes	job-attributes-sequence
Unsupported Attributes	unsupported- attributes-sequence
Requested Attributes (Get-Job-Attributes)	job-attributes-sequence
Requested Attributes (Get-Printer-Attributes)	printer-attributes-sequence
Document Content	in a special position as described above

388 If an operation contains attributes from more than one job object (e.g. Get-Jobs response), the attributes from each job object  
 389 MUST be in a separate job-attribute-sequence, such that the attributes from the ith job object are in the ith job-attribute-sequence.  
 390 See Section 13 "Appendix A: Protocol Examples" for table showing the application of the rules above.

### 391 **3.10 Value Length**

392 Each attribute value MUST be preceded by a SIGNED-SHORT, which MUST specify the number of octets in the value which  
 393 follows this length, exclusive of the two bytes specifying the length.

394 For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets.

395 For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string and  
 396 without any padding characters.

397 If a value-tag contains an "out-of-band" value defined in this document, such as "unsupported", the value-length MUST be 0 and  
 398 the value empty; the value has no meaning when the value-tag has one of these "out-of-band" values. However, the definitions of  
 399 additional "out-of-band" values in future documents are able to explicitly use the value field and have a value-length that is non-  
 400 zero, if there is a need for additional information to be associated with the out-of-band value. Unless the definition of an "out-of-  
 401 band" value explicitly allows for a value, the value-length MUST be 0 and the value empty.

### 402 **3.11 (Attribute) Value**

404 The syntax types and most of the details of the representation of attribute values are defined in the IPP model document. The  
 405 table below augments the information in the model document, and defines the syntax types from the model document in terms of  
 406 the 5 basic types defined in section 3 "Encoding of the Operation Layer". The 5 types are US-ASCII-STRING, LOCALIZED-  
 407 STRING, SIGNED-INTEGER, SIGNED-SHORT, SIGNED-BYTE, and OCTET-STRING.

**Syntax of Attribute Value****Encoding**

textWithoutLanguage,  
nameWithoutLanguage

LOCALIZED-STRING.

textWithLanguage

OCTET\_STRING consisting of 4 fields:

- a. a SIGNED-SHORT which is the number of octets in the following field
- b a value of type natural-language,
- c. a SIGNED-SHORT which is the number of octets in the following field,
- d. a value of type textWithoutLanguage.

The length of a textWithLanguage value MUST be 4 + the value of field a + the value of field c.

nameWithLanguage

OCTET\_STRING consisting of 4 fields:

- a. a SIGNED-SHORT which is the number of octets in the following field
- b. a value of type natural-language,
- c. a SIGNED-SHORT which is the number of octets in the following field
- d. a value of type nameWithoutLanguage.

The length of a nameWithLanguage value MUST be 4 + the value of field a + the value of field c.

charset, naturalLanguage,  
mimeMediaType, keyword, uri, and  
uriScheme

US-ASCII-STRING.

boolean

SIGNED-BYTE where 0x00 is 'false' and 0x01 is 'true'.

integer and enum

a SIGNED-INTEGER.

dateTime

OCTET-STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [RFC1903].

resolution

OCTET\_STRING consisting of nine octets of 2 SIGNED-INTEGERS followed by a SIGNED-BYTE. The first SIGNED-INTEGER contains the value of cross feed direction resolution. The second SIGNED-INTEGER contains the value of feed direction resolution. The SIGNED-BYTE contains the units value.

rangeOfInteger

Eight octets consisting of 2 SIGNED-INTEGERS. The first SIGNED-INTEGER contains the lower bound and the second SIGNED-INTEGER contains the upper bound.

1setOf X

Encoding according to the rules for an attribute with more than 1 value. Each value X is encoded according to the rules for encoding its type.

octetString

OCTET-STRING

408 The type of the value in the model document determines the encoding in the value and the value of the value-tag.

409 **3.12 Data**

410 The data part MUST include any data required by the operation

411

## 412 **4. Encoding of Transport Layer**

413 HTTP/1.1 [RFC2616] is the transport layer for this protocol.

414 The operation layer has been designed with the assumption that the transport layer contains the following information:

415 - the URI of the target job or printer operation

416 - the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a length.

417

418 It is REQUIRED that a printer implementation support HTTP over the IANA assigned Well Known Port 631 (the IPP default  
419 port), though a printer implementation may support HTTP over some other port as well.

420 Each HTTP operation MUST use the POST method where the request-URI is the object target of the operation, and where the  
421 "Content-Type" of the message-body in each request and response MUST be "application/ipp". The message-body MUST  
422 contain the operation layer and MUST have the syntax described in section 3.2 "Syntax of Encoding". A client implementation  
423 MUST adhere to the rules for a client described for HTTP1.1 [RFC2616]. A printer (server) implementation MUST adhere the  
424 rules for an origin server described for HTTP1.1 [RFC2616].

425 An IPP server sends a response for each request that it receives. If an IPP server detects an error, it MAY send a response before  
426 it has read the entire request. If the HTTP layer of the IPP server completes processing the HTTP headers successfully, it MAY  
427 send an intermediate response, such as "100 Continue", with no IPP data before sending the IPP response. A client MUST  
428 expect such a variety of responses from an IPP server. For further information on HTTP/1.1, consult the HTTP documents  
429 [RFC2616].

430 An HTTP server MUST support chunking for IPP requests, and an IPP client MUST support chunking for IPP responses  
431 according to HTTP/1.1[RFC2616]. Note: this rule causes a conflict with non-compliant implementations of HTTP/1.1 that  
432 don't support chunking for POST methods, and this rule may cause a conflict with non-compliant implementations of HTTP/1.1  
433 that don't support chunking for CGI scripts

## 434 **5. IPP URL Scheme**

435 The IPP/1.1 document defines a new scheme 'ipp' as the value of a URL that identifies either an IPP printer object or an IPP job  
436 object. The IPP attributes using the 'ipp' scheme are specified below. Because the HTTP layer does not support the 'ipp' scheme,  
437 a client MUST map 'ipp' URLs to 'http' URLs, and then follows the HTTP [RFC2616][RFC2617] rules for constructing a  
438 Request-Line and HTTP headers. The mapping is simple because the 'ipp' scheme implies all of the same protocol semantics as  
439 that of the 'http' scheme [RFC2616], except that it represents a print service and the implicit (default) port number that clients use  
440 to connect to a server is port 631.

441 In the remainder of this section the term 'ipp-URL' means a URL whose scheme is 'ipp' and whose implicit (default) port is 631.  
442 The term 'http-URL' means a URL whose scheme is 'http', and the term 'https-URL' means a URL whose scheme is 'https',

443 A client and an IPP object (i.e. the server) MUST support the ipp-URL value in the following IPP attributes.

444 job attributes:

445 job-uri

446 job-printer-uri

447 printer attributes:

448 printer-uri-supported

449 operation attributes:  
450 job-uri  
451 printer-uri  
452

453 Each of the above attributes identifies a printer or job object. The ipp-URL is intended as the value of the attributes in this list,  
454 and for no other attributes. All of these attributes have a syntax type of 'uri', but there are attributes with a syntax type of 'uri' that  
455 do not use the 'ipp' scheme, e.g. 'job-more-info'.  
456

457 If a printer registers its URL with a directory service, the printer **MUST** register an ipp-URL.

458 User interfaces are beyond the scope of this document. But if software exposes the ipp-URL values of any of the above five  
459 attributes to a human user, it is **REQUIRED** that the human see the ipp-URL as is.  
460

461 When a client sends a request, it **MUST** convert a target ipp-URL to a target http-URL for the HTTP layer according to the  
462 following rules:

- 463 1. change the 'ipp' scheme to 'http'
- 464 2. add an explicit port 631 if the URL does not contain an explicit port. Note: port 631 is the IANA assigned Well Known  
465 Port for the 'ipp' scheme.

466 The client **MUST** use the target http-URL in both the HTTP Request-Line and HTTP headers, as specified by  
467 HTTP[RFC2616][RFC2617]. However, the client **MUST** use the target ipp-URL for the value of the "printer-uri" or "job-uri"  
468 operation attribute within the application/ipp body of the request. The server **MUST** use the ipp-URL for the value of the  
469 "printer-uri", "job-uri" or "printer-uri-supported" attributes within the application/ipp body of the response.  
470

471 For example, when an IPP client sends a request directly (i.e. no proxy) to an ipp-URL "ipp://myhost.com/myprinter/myqueue",  
472 it opens a TCP connection to port 631 (the ipp implicit port) on the host "myhost.com" and sends the following data:  
473

```
474 POST /myprinter/myqueue HTTP/1.1  
475 Host: myhost.com:631  
476 Content-type: application/ipp  
477 Transfer-Encoding: chunked  
478 ...  
479 "printer-uri" "ipp://myhost.com/myprinter/myqueue"  
480 (encoded in application/ipp message body)  
481 ...
```

482 As another example, when an IPP client sends the same request as above via a proxy "myproxy.com", it opens a TCP connection  
483 to the proxy port 8080 on the proxy host "myproxy.com" and sends the following data:  
484

```
485  
486 POST http://myhost.com:631/myprinter/myqueue HTTP/1.1  
487 Host: myproxy.com:8080  
488 Content-type: application/ipp  
489 Transfer-Encoding: chunked  
490 ...  
491 "printer-uri" "ipp://myhost.com/myprinter/myqueue"  
492 (encoded in application/ipp message body)  
493 ...
```

494 The proxy then connects to the IPP origin server with headers that are the same as the "no-proxy" example above.  
495

## 496 6. IANA Considerations

497 This section describes the procedures for allocating encoding for the following IETF standards track extensions and vendor  
498 extensions to the IPP/1.1 Encoding and Transport document:

- 499 1. attribute syntaxes - see [ipp-mod] section 6.3  
500 2. attribute groups - see [ipp-mod] section 6.5  
501 3. out-of-band attribute values - see [ipp-mod] section 6.7  
502

503 These extensions follow the "type2" registration procedures defined in [ipp-mod] section 6. Extensions registered for use with  
504 IPP/1.1 are OPTIONAL for client and IPP object conformance to the IPP/1.1 Encoding and Transport document.

505 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. The [ipp-mod] Section 11  
506 describes how to propose new registrations for consideration. IANA will reject registration proposals that leave out required  
507 information or do not follow the appropriate format described in [ipp-mod] Section 11. The IPP/1.1 Encoding and Transport  
508 document may also be extended by an appropriate RFC that specifies any of the above extensions.

## 509 **7. Internationalization Considerations**

510 See the section on "Internationalization Considerations" in the document "Internet Printing Protocol/1.1: Model and Semantics"  
511 [ipp-mod] for information on internationalization. This document adds no additional issues.

## 512 **8. Security Considerations**

513 The IPP Model and Semantics document [ipp-mod] discusses high level security requirements (Client Authentication, Server  
514 Authentication and Operation Privacy). Client Authentication is the mechanism by which the client proves its identity to the  
515 server in a secure manner. Server Authentication is the mechanism by which the server proves its identity to the client in a secure  
516 manner. Operation Privacy is defined as a mechanism for protecting operations from eavesdropping.

### 517 **8.1 Security Conformance Requirements**

518 This section defines the security requirements for IPP clients and IPP objects.

#### 519 **8.1.1 Digest Authentication**

520 IPP clients MUST support:

- 521 Digest Authentication [RFC2617].  
522 MD5 and MD5-sess MUST be implemented and supported.  
523 The Message Integrity feature NEED NOT be used.

524

525 IPP Printers SHOULD support:

- 526 Digest Authentication [RFC2617].  
527 MD5 and MD5-sess MUST be implemented and supported.  
528 The Message Integrity feature NEED NOT be used.

529

530 The reasons that IPP Printers SHOULD (rather than MUST) support Digest Authentication are:

531  
532  
533  
534  
535  
536  
537  
538  
539  
540  
541  
542  
543

1. While Client Authentication is important, there is a certain class of printer devices where it does not make sense. Specifically, a low-end device with limited ROM space and low paper throughput may not need Client Authentication. This class of device typically requires firmware designers to make trade-offs between protocols and functionality to arrive at the lowest-cost solution possible. Factored into the designer's decisions is not just the size of the code, but also the testing, maintenance, usefulness, and time-to-market impact for each feature delivered to the customer. Forcing such low-end devices to provide security in order to claim IPP/1.1 conformance would not make business sense and could potentially stall the adoption of the standard.
2. Print devices that have high-volume throughput and have available ROM space have a compelling argument to provide support for Client Authentication that safeguards the device from unauthorized access. These devices are prone to a high loss of consumables and paper if unauthorized access should occur.

### 544 **8.1.2 Transport Layer Security (TLS)**

545 IPP Printers SHOULD support Transport Layer Security (TLS) [RFC2246] for Server Authentication and Operation Privacy. IPP  
546 Printers MAY also support TLS for Client Authentication. If an IPP Printer supports TLS, it MUST support the  
547 TLS\_DHE\_DSS\_WITH\_3DES\_EDE\_CBC\_SHA cipher suite as mandated by RFC 2246 [RFC2246]. All other cipher suites are  
548 OPTIONAL. An IPP Printer MAY support Basic Authentication (described in HTTP/1.1 [RFC2617]) for Client Authentication  
549 if the channel is secure. TLS with the above mandated cipher suite can provide such a secure channel.

550 If a IPP client supports TLS, it MUST support the TLS\_DHE\_DSS\_WITH\_3DES\_EDE\_CBC\_SHA cipher suite as mandated by  
551 RFC 2246 [RFC2246]. All other cipher suites are OPTIONAL.

552 The IPP Model and Semantics document defines two printer attributes ("uri-authentication-supported" and "uri-security-  
553 supported") that the client can use to discover the security policy of a printer. That document also outlines IPP-specific security  
554 considerations and should be the primary reference for security implications with regard to the IPP protocol itself. For backward  
555 compatibility with IPP version 1.0, IPP clients and printers may also support SSL3 [ssl]. This is in addition to the security  
556 required in this document.

## 557 **8.2 Using IPP with TLS**

558 IPP/1.1 uses the "Upgrading to TLS Within HTTP/1.1" mechanism [http-tls]. An initial IPP request never uses TLS. The client  
559 requests a secure TLS connection by using the HTTP "Upgrade" header, while the server agrees in the HTTP response. The  
560 switch to TLS occurs either because the server grants the client's request to upgrade to TLS, or a server asks to switch to TLS in  
561 its response. Secure communication begins with a server's response to switch to TLS.

## 562 **9. Interoperability with IPP/1.0 Implementations**

563 It is beyond the scope of this specification to mandate conformance with previous versions. IPP/1.1 was deliberately designed,  
564 however, to make supporting previous versions easy. It is worth noting that, at the time of composing this specification (1999),  
565 we would expect IPP/1.1 Printer implementations to:

566 understand any valid request in the format of IPP/1.0, or 1.1;

567 respond appropriately with a response containing the same "version-number" parameter value used by the client in the  
568 request.

569 And we would expect IPP/1.1 clients to:

570 understand any valid response in the format of IPP/1.0, or 1.1.

## 571 9.1 The "version-number" Parameter

572 The following are rules regarding the "version-number" parameter (see section 3.3):

- 573 1. Clients **MUST** send requests containing a "version-number" parameter with a '1.1' value and **SHOULD** try supplying  
574 alternate version numbers if they receive a 'server-error-version-not-supported' error return in a response.
- 575 2. IPP objects **MUST** accept requests containing a "version-number" parameter with a '1.1' value (or reject the request for  
576 reasons other than 'server-error-version-not-supported').
- 577 3. It is recommended that IPP objects accept any request with the major version '1' (or reject the request for reasons other  
578 than 'server-error-version-not-supported'). See [ipp-mod] "versions" sub-section.
- 579 4. In any case, security **MUST NOT** be compromised when a client supplies a lower "version-number" parameter in a  
580 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is configured to  
581 enforce Digest Authentication, it **MUST** do the same for a version '1.0' request.

## 582 9.2 Security and URL Schemes

583 The following are rules regarding security, the "version-number" parameter, and the URL scheme supplied in target attributes and  
584 responses:

- 585 1. When a client supplies a request, the "printer-uri" or "job-uri" target operation attribute **MUST** have the same scheme  
586 as that indicated in one of the values of the "printer-uri-supported" Printer attribute.
- 587 2. When the server returns the "job-printer-uri" or "job-uri" Job Description attributes, it **SHOULD** return the same  
588 scheme ('ipp', 'https', 'http', etc.) that the client supplied in the "printer-uri" or "job-uri" target operation attributes in the  
589 Get-Job-Attributes or Get-Jobs request, rather than the scheme used when the job was created. However, when a client  
590 requests job attributes using the Get-Job-Attributes or Get-Jobs operations, the jobs and job attributes that the server  
591 returns depends on: (1) the security in effect when the job was created, (2) the security in effect in the query request,  
592 and (3) the security policy in force.
- 593 3. It is recommended that if a server registers a non-secure ipp-URL with a directory service (see [IPP-MOD] "Generic  
594 Directory Schema" Appendix), then it also register an http-URL for interoperability with IPP/1.0 clients (see section  
595 9).
- 596 4. In any case, security **MUST NOT** be compromised when a client supplies an 'http' or other non-secure URL scheme in  
597 the target "printer-uri" and "job-uri" operation attributes in a request.

## 13. Appendix A: Protocol Examples

652

### 13.1 Print-Job Request

653

654

655

The following is an example of a Print-Job request with job-name, copies, and sides specified. The "ipp-attribute-fidelity" attribute is set to 'true' so that the print request will fail if the "copies" or the "sides" attribute are not supported or their values are not supported.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0002	Print-Job	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural-language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag
0x000B		name-length
printer-uri	printer-uri	name
0x0015		value-length

0x0013		value-length
two-sided-long-edge	two-sided-long-edge	value
0x03	end-of-attributes	end-of-attributes-tag
%!PS...	<PostScript>	data

656 **13.2 Print-Job Response (successful)**

657 Here is an example of a successful Print-Job response to the previous Print-Job request. The printer supported the "copies" and  
 658 "sides" attributes and their supplied values. The status code returned is 'successful-ok'.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0000	successful-ok	status-code
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length

job-state	job-state	name
0x0004		value-length
0x0003	pending	value
0x03	end-of-attributes	end-of-attributes-tag

659

660 **13.3 Print-Job Response (failure)**

661 Here is an example of an unsuccessful Print-Job response to the previous Print-Job request. It fails because, in this case, the  
 662 printer does not support the "sides" attribute and because the value '20' for the "copies" attribute is not supported. Therefore, no  
 663 job is created, and neither a "job-id" nor a "job-uri" operation attribute is returned. The error code returned is 'client-error-  
 664 attributes-or-values-not-supported' (0x040B).  
 665

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x040B	client-error-attributes-or-values-not-supported	status-code
0x00000001	1	request-id
0x01	start operation-attributes	operation-attribute tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length

0x41	textWithoutLanguage type	value-tag
0x000E		name-length
status-message	status-message	name
0x002F		value-length
client-error-attributes- or-values-not- supported	client-error-attributes-or-values-not-supported	value
0x05	start unsupported-attributes	unsupported-attributes tag
0x21	integer type	value-tag
0x0006		name-length
copies	copies	name
0x0004		value-length
0x00000014	20	value
0x10	unsupported (type)	value-tag
0x0005		name-length
sides	sides	name
0x0000		value-length
0x03	end-of-attributes	end-of-attributes-tag

666  
 667  
 668  
 669 **13.4 Print-Job Response (success with attributes ignored)**

670 Here is an example of a successful Print-Job response to a Print-Job request like the previous Print-Job request, except that the  
 671 value of 'ipp-attribute-fidelity' is false. The print request succeeds, even though, in this case, the printer supports neither the  
 672 "sides" attribute nor the value '20' for the "copies" attribute. Therefore, a job is created, and both a "job-id" and a "job-uri"  
 673 operation attribute are returned. The unsupported attributes are also returned in an Unsupported Attributes Group. The error code  
 674 returned is 'successful-ok-ignored-or-substituted-attributes' (0x0001).

675

<b>Octets</b>	<b>Symbolic Value</b>	<b>Protocol field</b>
0x0101	1.1	version-number
0x0001	successful-ok-ignored-or-substituted-attributes	status-code
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag

0x0015		value-length
ipp://forest/pinetree	printer pinetree	value
0x45	uri type	value-tag
0x000C		name-length
document-uri	document-uri	name
0x0011		value-length
ftp://foo.com/foo	ftp://foo.com/foo	value
0x42	nameWithoutLanguage type	value-tag
0x0008		name-length
job-name	job-name	name
0x0006		value-length
foobar	foobar	value
0x02	start job-attributes	job-attributes-tag
0x21	integer type	value-tag
0x0006		name-length
copies	copies	name
0x0004		value-length
0x00000001	1	value
0x03	end-of-attributes	end-of-attributes-tag

680

681 **13.6 Create-Job Request**

682 The following is an example of Create-Job request with no parameters and no attributes:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0005	Create-Job	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural- language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag

## 690 **14. Appendix B: Registration of MIME Media Type Information for** 691 **"application/ipp"**

692 This appendix contains the information that IANA requires for registering a MIME media type. The information following this  
693 paragraph will be forwarded to IANA to register application/ipp whose contents are defined in Section 3 "Encoding of the  
694 Operation Layer" in this document:

695 **MIME type name:** application

696 **MIME subtype name:** ipp

697 A Content-Type of "application/ipp" indicates an Internet Printing Protocol message body (request or response). Currently there  
698 is one version: IPP/1.1, whose syntax is described in Section 3 "Encoding of the Operation Layer" of [ipp-pro], and whose  
699 semantics are described in [ipp-mod].

700 **Required parameters:** none

701 **Optional parameters:** none

702 **Encoding considerations:**

703 IPP/1.1 protocol requests/responses MAY contain long lines and ALWAYS contain binary data (for example attribute value  
704 lengths).

705 **Security considerations:**

706 IPP/1.1 protocol requests/responses do not introduce any security risks not already inherent in the underlying transport protocols.  
707 Protocol mixed-version interworking rules in [ipp-mod] as well as protocol encoding rules in [ipp-pro] are complete and  
708 unambiguous.

709 **Interoperability considerations:**

710 IPP/1.1 requests (generated by clients) and responses (generated by servers) MUST comply with all conformance requirements  
711 imposed by the normative specifications [ipp-mod] and [ipp-pro]. Protocol encoding rules specified in [ipp-pro] are  
712 comprehensive, so that interoperability between conforming implementations is guaranteed (although support for specific  
713 optional features is not ensured). Both the "charset" and "natural-language" of all IPP/1.1 attribute values which are a  
714 LOCALIZED-STRING are explicit within IPP protocol requests/responses (without recourse to any external information in  
715 HTTP, SMTP, or other message transport headers).

716 **Published specifications:**

717 [ipp-mod] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.1: Model and Semantics"  
718 draft-ietf-ipp-model-v11-06.txt, March 1, 2000.

719 [ipp-pro] Herriot, R., Butler, S., Moore, P., Turner, R., "Internet Printing Protocol/1.1: Encoding and Transport", draft-ietf-  
720 ipp-protocol-v11-05.txt, March 1, 2000.

721 **Applications which use this media type:**

722 Internet Printing Protocol (IPP) print clients and print servers, communicating using HTTP/1.1 (see [IPP-PRO]), SMTP/ESMTP,  
723 FTP, or other transport protocol. Messages of type "application/ipp" are self-contained and transport-independent, including  
724 "charset" and "natural-language" context for any LOCALIZED-STRING value.

725 **Person & email address to contact for further information:**

726 Tom Hastings  
727 Xerox Corporation  
728 737 Hawaii St. ESAE-231  
729 El Segundo, CA

730 Phone: 310-333-6413  
731 Fax: 310-333-5514  
732 Email: hastings@cp10.es.xerox.com

733 or

734 Robert Herriot  
735 Xerox Corporation  
736 3400 Hillview Ave., Bldg #1  
737 Palo Alto, CA 94304

738 Phone: 650-813-7696  
739 Fax: 650-813-6860  
740 Email: robert.herriot@pahv.xerox.com

741 **Intended usage:**

742 COMMON

743 **15. Appendix C: Changes from IPP/1.0**

744 IPP/1.1 is identical to IPP/1.0 [RFC2565] with the follow changes:

- 745 1. Attributes values that identify a printer or job object use a new 'ipp' scheme. The 'http' and 'https' schemes are supported only  
746 for backward compatibility. See section 5.
- 747 2. Clients MUST support of Digest Authentication, IPP Printers SHOULD support Digest Authentication. See Section 8.1.1
- 748 3. TLS is recommended for channel security. In addition, SSL3 may be supported for backward compatibility. See Section  
749 8.1.2
- 750 4. It is recommended that IPP/1.1 objects accept any request with major version number '1'. See section 9.1.
- 751 5. IPP objects SHOULD return the URL scheme requested for "job-printer-uri" and "job-uri" Job Attributes, rather than the  
752 URL scheme used to create the job. See section 9.2.
- 753 6. The IANA and Internationalization sections have been added. The terms "private use" and "experimental" have been  
754 changed to "vendor extension". The reserved allocations for attribute group tags, attribute syntax tags, and out-of-band  
755 attribute values have been clarified as to which are reserved to future IETF standards track documents and which are  
756 reserved to vendor extension. Both kinds of extensions use the type2 registration procedures as defined in [ipp-mod].
- 757 7. Clarified that future "out-of-band" value definitions may use the value field if additional information is needed.

## 758 **16. Full Copyright Statement**

759 The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to  
760 pertain to the implementation or use of the technology described in this document or the extent to which any license under such  
761 rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information  
762 on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-  
763 11[BCP-11]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or  
764 the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or  
765 users of this specification can be obtained from the IETF Secretariat.

766 The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary  
767 rights which may cover technology that may be required to practice this standard. Please address the information to the IETF  
768 Executive Director.
