10 Internet Printing Protocol (IPP):  
11 **Printer Installation Extension**

12  
13 Copyright (C) The Internet Society (20010). All Rights Reserved.

14 Status of this Memo

15 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026].  
16 Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its  
17 working groups. Note that other groups may also distribute working documents as Internet-Drafts.

18 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or  
19 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or  
20 to cite them other than as "work in progress".

21  
22 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

23 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

24 **Abstract**

25 Various client platforms require that some setting up take place at the workstation before the client can  
26 properly submit jobs to a specific printer. This setup process is sometimes referred to as printer installation.  
27 Most clients need some information about the printer being installed as well as support files to complete the  
28 printer installation. The nature of the support files varies depending on the specific client platform, from simple  
29 configuration files to highly sophisticated printer drivers. This document refers to these support files as "Client  
30 Print Support Files". Traditionally, the selection and installation of the correct Client Print Support Files has  
31 been error prone. The selection and installation process can be simplified and even automated if the  
32 workstation can learn some key information about the printer and which sets of Client Print Support Files are  
33 available. Such key information includes: operating system type, CPU type, document-format (PDL), natural  
34 language, ~~etc~~compression mechanism, file type, client file name, policy for automatic loading, file size, file  
35 version, file date and time, file information description, and digital signature. This document describes the IPP  
36 extensions that enable workstations to obtain the information needed to perform a proper printer driver  
37 installation using IPP, including security for downloading executable code and data.

38

Parra, Tronson, Hastings

Expires August 28, 2001

[page 1]

39       The full set of IPP documents includes:

40           Design Goals for an Internet Printing Protocol [RFC2567]  
41           Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]  
42           Internet Printing Protocol/1.1: Model and Semantics [RFC2911]  
43           Internet Printing Protocol/1.1: Encoding and Transport [RFC2910]  
44           Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]  
45           Mapping between LPD and IPP Protocols [RFC2569]

46  
47       The “Design Goals for an Internet Printing Protocol” document takes a broad look at distributed printing  
48       functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included in a  
49       printing protocol for the Internet. It identifies requirements for three types of users: end users, operators, and  
50       administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0. A few OPTIONAL  
51       operator operations have been added to IPP/1.1.

52       The “Rationale for the Structure and Model and Protocol for the Internet Printing Protocol” document  
53       describes IPP from a high level view, defines a roadmap for the various documents that form the suite of IPP  
54       specification documents, and gives background and rationale for the IETF working group’s major decisions.

55       The “Internet Printing Protocol/1.1: Encoding and Transport” document is a formal mapping of the abstract  
56       operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It defines the encoding  
57       rules for a new Internet MIME media type called “application/ipp”. This document also defines the rules for  
58       transporting a message body over HTTP whose Content-Type is “application/ipp”. This document defines a  
59       new scheme named ‘ipp’ for identifying IPP printers and jobs.

60       The “Internet Printing Protocol/1.1: Implementer’s Guide” document gives insight and advice to implementers  
61       of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some of the considerations  
62       that may assist them in the design of their client and/or IPP object implementations. For example, a typical  
63       order of processing requests is given, including error checking. Motivation for some of the specification  
64       decisions is also included.

65       The “Mapping between LPD and IPP Protocols” document gives some advice to implementers of gateways  
66       between IPP and LPD (Line Printer Daemon) implementations.

## 102 1 Introduction

103 A common configuration for printing from a workstation requires that some Client Print Support Files (e.g.,  
104 PPD, printer driver files) specific to the target printer be installed on that workstation. Selection and  
105 configuration of the appropriate Client Print Support Files can be simplified and even automated if the  
106 workstation can obtain some key information about the printer and which sets of Client Print Support Files are  
107 available. Such key information includes: operating system type, CPU type, document-format (PDL), natural  
108 language, compression mechanism, file type, client file name, policy for automatic loading, file size, file version,  
109 file date and time, file information description, and digital signature~~etc.~~. With a few extensions, IPP provides a  
110 simple and reliable vehicle for printers to convey this information to interested workstations. The IPP  
111 extensions described in this document enable a flexible solution for installing Client Print Support Files on  
112 workstations running different operating systems and for printers of all makes and models. It allows Client  
113 Print Support Files to be downloaded from repositories of different sorts. A possible repository for the files is  
114 the printer itself. The extensions necessary for getting Client Print Support Files from the printer are included  
115 in this document, including security for downloading executable code and data.

## 116 2 Terminology

117 Client Print Support Files - a set of files, such as a printer driver, font metric file, printer configuration file  
118 (PPD, GPD, etc.) that support a client printing to a particular Printer. A Printer ~~can~~MAY have multiple sets of  
119 Client Print Support Files that work for different operating systems, document formats, natural languages,  
120 CPUs, etc.

121 This document uses terms such as “attributes”, “keywords”, and “support”. These terms have special meaning  
122 and are defined in the model terminology [RFC2911] section 12.2. This document also uses the terms “IPP  
123 Printer”, “Printer” and “Printer object” interchangeably as in [RFC2911] to mean the software entity that  
124 accepts IPP operation requests and returns IPP operation responses (see [RFC2911] section 2).

125 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY, NEED  
126 NOT, and OPTIONAL, have special meaning relating to conformance. These terms are defined in  
127 [RFC2911] section 12.1 on conformance terminology, most of which is taken from RFC 2119 [RFC2119].

128 This section defines the following additional terms that are used throughout this document:

129 REQUIRED: if an implementation supports the extensions described in this document, it MUST support  
130 a REQUIRED feature.

131 OPTIONAL: if an implementation supports the extensions described in this document, it MAY support  
132 an OPTIONAL feature.

## 133 3 Model Extensions

134 To assist workstations in the printer installation process, an IPP printer needs to provide the workstation with  
135 information about the Client Print Support Files, such as their name and location/s. This information needs

136 to match the workstation's specific environment, such as its operating system, preferred natural language, and  
137 preferred document format.

138 The following extensions to the IPP model enable assisted or automated printer installation. This section  
139 describes each extension in detail.

- 140 - A new REQUIRED Printer Description attribute: "client-print-support-files-supported" (1setOf  
141 octetString(MAX)).  
142 - A new REQUIRED Get-Printer-Attributes operation attribute: "client-print-support-files-filter"  
143 (octetString(MAX)).  
144 - A new RECOMMENDED printer operation: Get-Client-Print-Support-Files.

145 **3.1 client-print-support-files-supported (1setOf octetString(MAX))**

146 An IPP Printer uses the REQUIRED Printer Description attribute "client-print-support-files-supported" to  
147 represent relevant information about all of the Client Print Support Files it supports. Each value is a composite  
148 UTF-8 string with well-defined fields (see Table 1). Each value string MUST be formatted as follows:

149 "uri=val<sub>1</sub>< field-name<sub>2</sub>=val<sub>21</sub>,...,val<sub>2p</sub>< ... < field-name<sub>n</sub>=val<sub>n1</sub>,...,val<sub>nq</sub><"

150 The first field MUST be the "uri" field. The remaining fields MAY be in any order.

151 The string MUST NOT include any control characters (hex 00 to 1F), even the so-called white space control  
152 characters (TAB, CR, and LF) anywhere. Only zero or more UTF-8 SPACE characters (hex 20) can be  
153 included and they can be included only IMMEDIATELY AFTER the punctuation delimiter character: "<", but  
154 NOT anywhere else, including after "=" and ",". However, if the UTF-8 SPACE character is needed in a file  
155 nameclient-file-name value, then each occurrence is included directly, without escaping (see example). On the  
156 other hand, if the UTF-8 SPACE character is needed in a URL value, then each occurrence is escaped as:  
157 "x20" "%20" (URI conventions - see [RFC2396]).

158 Table 1 lists the REQUIRED fields that a Printer MUST support and the OPTIONAL fields that a Printer  
159 MAY support in the "client-print-support-files-supported" (1setOf octetString(MAX)) Printer Description  
160 attribute. A Printer implementation MAY support additional fields using the same syntax. Values are defined  
161 to be either CASE-SENSITIVE or ALL-LOWER-CASE according to the definitions for the attribute  
162 syntaxes from [RFC2911] (set off by single quotes in the table). The CASE-SENSITIVE values MAY have  
163 upper and lower case letters as for the corresponding attribute syntaxes in [RFC2911]. The LOWER-CASE  
164 values MUST have all lower case alphabetic letters. Additional characters, such as digits, hyphen-minus (-),  
165 period (.), and slash (/) are according to the corresponding attribute syntaxes in [RFC2911].

166 Clients SHOULD ignore fields they don't recognize in a given value. This allows for future extensions to the  
167 format of the string without breaking compatibility with earlier clients.

**Table 1 - “client-print-support-files-supported” attribute fields**

Field name	Field value
“uri”	<p>One REQUIRED CASE-SENSITIVE ‘uri’ string identifying the uri where to obtain the support files for each OS platform, document format, and natural language the printer supports. This MUST be the first field in each value. Examples of uri schemes that MAY be found here are ‘ftp’, ‘http’, and ‘ipp’. The ‘ftp’ and ‘http’ schemed URIs identify the archive file that contains all the necessary client support files.</p> <p>The ‘ipp’ schemed URIs identify the archive file <u>which may be that clients MAY</u> obtained from the Printer using the Get-Client-Print-Support-Files operation (see section 3.3). <u>The URI MUST be a valid URI to the same Printer object, i.e., one of the values of the Printer’s “printer-uri-supported” attribute.</u> The ‘ipp’ URI is used to distinguish between multiple Client Print Support Files in an implementation dependent manner <u>using the URL query syntax (e.g., “?drv-id=xxx”) [RFC2396], such as using a file URL parameter (“file=xxx”). The query part MUST NOT exceed 127 octets, not counting the “?” character that begins the query part.</u> A Printer SHOULD support the ‘ipp’ scheme.</p>
“os-type”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘keyword’ strings identifying the operating system types supported by this set of Client Print Support Files. Valid values <u>include are</u> the operating system names defined in the IANA document [os-names] <u>and the special keyword value: ‘unknown’</u>. Although the IANA registry requires that the names be all upper-case, the values MUST be all lower case in this field (plus hyphen-minus (-), period (.), and slash (/)). Examples: ‘linux’, ‘linux-2.2’, ‘os/2’, ‘sun-os-4.0’, ‘unix’, ‘unix-bsd’, ‘win32’, ‘windows-95’, ‘windows-98’, ‘windows-ce’, ‘windows-nt’, ‘windows-nt-4’, ‘windows-nt-5’, ‘unknown’.</p>
“cpu-type”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘keyword’ strings identifying the CPU types supported by this set of Client Print Support Files. <u>The values indicate the CPU family independent of the CPU manufacturer. Valid keyword values (or compatible) are: ‘unknown’, ‘x86-16’, ‘x86-32’, ‘x86-64’, ‘dec-vax’, ‘alpha’, ‘power-pc’, ‘m-68000’, ‘sparc’, ‘itanium’, ‘mips’, ‘arm’ and will be used as the initial value for the “cpu-type” IANA registry. In addition, the special keyword value: ‘unknown’ is valid.</u></p>
“document-format”	<p>One or more REQUIRED comma-separated CASE-SENSITIVE ‘document-formatmimeMediaType’ strings identifying the document formats supported by this set of Client Print Support Files. Valid values are the string representation of the IPP mimeMediaType attribute syntax (see [RFC2911] <u>section 4.1.9</u>, for example ‘application/postscript’). <u>In addition, the special keyword value: ‘unknown’ is a valid value.</u></p>
“natural-language”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘naturalLanguage’ strings identifying the natural language used by this set of Client Print Support Files. Valid values are the string representation of the IPP ‘naturalLanguage’ attribute syntax (see [RFC2911]</p>

Field name	Field value
	<u>section 4.1.8), for example ‘en’ and ‘en-us’.</u> <u>In addition, the special keyword value: ‘unknown’ is a valid value.</u>
“compression”	One REQUIRED LOWER-CASE ‘keyword’ string identifying the mechanism used to compress this set of Client Print Support Files. All files needed for the installation of a printer driver MUST be compressed into a single file. Valid <u>keyword</u> values are <u>the keywords defined by [RFC2911] or registered with IANA for use in the IPP “compression” and “compression-supported” attributes. See [RFC2911] section 4.4.32), for example : ‘deflate’, ‘gzip’, ‘compress’.</u> The ‘none’ value <u>is allowed but</u> limits the uncompressed Client Print Support File to a single file. <u>The values for the “compression” field that a Printer supports NEED NOT be the same values that the Printer is configured to support in Job Creation operations as indicated in the Printer’s “compression-supported” attribute.</u>
“file-type”	One or more REQUIRED comma-separated LOWER-CASE ‘keyword’ strings identifying the type of the Client Print Support Files. Valid <u>keyword</u> values are: ‘printer-driver’, ‘ppd’, ‘updf’, ‘gpd’.
“ <u>client</u> -file-name”	One REQUIRED CASE-SENSITIVE string identifying the name by which the Client Print Support Files will be installed on the workstation. For Client Print Support Files of type ‘printer-driver’, this is also the name that identifies this printer driver in an .inf file.
“policy”	One <u>REQUIRED OPTIONAL</u> LOWER-CASE ‘keyword’ string indicating the policy for automatic loading. <u>Valid keyword values are: ‘unknown’, ‘manufacturer-recommended’, ‘administrator-recommended’, ‘manufacturer-experimental, and ‘administrator-experimental’.</u> The experimental values are for beta test.
“file-size”	One OPTIONAL file size in octets represented as ASCII decimal digits.
“file-version”	One OPTIONAL LOWER-CASE version number. Recommended to be of the form “Major.minor[.revision]” <u>where</u> “Major” is the major version number, “minor” is the minor version number and “revision” is an optional revision number.
“file-date-time”	One OPTIONAL File CASE-SENSITIVE creation date and time according to ISO 8601 where all fields are fixed length with leading zeroes (see [RFC2518] Appendix 2). Examples: 2000-01-01T23:09:05Z and 2000-01-01T02:59:59-04.00
“ <u>file</u> -info”	<u>One OPTIONAL CASE-SENSITIVE human readable ‘text’ string describing this set of Client Print Support Files. The natural language for this value MUST be the natural language indicated by the Printer’s “natural-language-configured” attribute. To avoid exceeding the maximum limit imposed on IPP attributes and to increase interoperability with other systems, the length of this field value MUST not exceed 127 characters.</u>
“ <u>digital</u> -signature”	<u>One REQUIRED LOWER-CASE ‘keyword’ string identifying the mechanism used to ensure the integrity and authenticity of this set of Client Print Support Files. Valid values are: ‘smime’, ‘pgp’, ‘dss’, and ‘xmldsig’ which are defined in [RFC2634], [RFC1991].</u>

Field name	Field value
	[dss], and [xmldsig], respectively. In addition, the special keyword value: ‘none’ is valid.

169        Each value MUST refer to one and only one set of Client Print Support Files, even if the files are  
 170        downloadable from various repositories (i.e., even if they are associated with multiple URIs).

171        **3.1.1      Use of Keyword Values in fields**

172        A number of the fields in Table 1 use keyword strings as values. The syntax of these keywords is the same as  
 173        in [RFC2911], including the use of private keywords. See [RFC2911] sections 4.1.3 and 6.1. Printer  
 174        implementers are strongly RECOMMENDED to submit additional keyword values for registration with IANA  
 175        according to the procedures for registering attributes. See section 7 and [RFC2911] section 6.1.

176        **3.1.2      Use of the Special Keyword Value: ‘unknown’**

177        A number of REQUIRED ‘keyword’ value fields have a special keyword value: ‘unknown’ defined. This  
 178        value is intended for use when the actual value is not known, such as by an administrator automatic software  
 179        configuring the IPP Printer object. However, it is strongly RECOMMENDED that other more meaningful  
 180        values be used, instead of the ‘unknown’ value whenever possible.

181        **3.1.3      Examples of “client-print-support-files-supported” attribute values**

182        The following illustrates what two valid values of the “client-print-support-files-supported” (1setOf  
 183        octetString(MAX)) Printer Description attribute might look like:

```
184        uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<
185        os-type=windows-95< cpu-type=x86-32<
186        document-format=application/postscript<
187        natural-language=en< compression=gzip<
188        install-file-type=printer-driver<
189        client-file-name=CompanyX-ModelY-driver.gz<
190        policy=manufacturer-recommended<

191        uri=ftp://mycompany.com/root/drivers/win95/CompanyX/ModelY.gz<
192        os-type=windows-95< cpu-type=x86-32<
193        document-format=application/postscript,application/vnd.hp-PCL<
194        natural-language=en,fr< compression=gzip<
195        install-file-type=printer-driver<
196        client-file-name=Company T Model Z driver.gz<
197        policy=manufacturer-recommended<
```

199        The above examples have been broken onto separate lines for readability in this document. However, there  
200      MUST NOT be any line breaks in the actual values.

201        The “client-print-support-files-supported” Printer Description attribute MAY be preset at manufacturing time  
202      ~~or set via the IPP Set Printer Attribute operation~~ or through administrative means outside the scope of [IPP](#)this  
203      document.

## 204     **3.2 Get-Printer-Attributes Operation Extension**

205        The “client-print-support-files-supported” Printer Description attribute defined in section 3.1 contains  
206      information, such as operating system, natural language, and document format, about *all* of the sets of Client  
207      Print Support Files. This section defines an extension to the Get-Printer-Attributes operation that allows a  
208      workstation to filter out all but the Client Print Support Files of interest.

### 209     **3.2.1 Get-Printer-Attributes Request**

210        A Printer MAY contain information about multiple sets of Client Print Support Files to match the different  
211      operating systems, natural languages and document formats it supports. A workstation ~~may~~MAY query this  
212      information by including the ‘client-print-support-files-supported’ keyword as a value of the “requested-  
213      attributes” operation attribute of the Get-Printer-Attributes operation.

#### 214     **3.2.1.1 client-print-support-files-filter (octetString(MAX)) operation attribute**

215        The client can request a subset of the values of the “client-print-support-files-supported” Printer attribute by  
216      supplying the “client-print-support-files-filter” (octetString(MAX)) operation attribute in the request as a filter.  
217      The filter value indicates in which Client Print Support Files the client is interested. The client MAY supply this  
218      attribute. The Printer MUST support this attribute.

219        The filter value of the “client-print-support-files-filter” attribute is a composite string with the same format as  
220      that of “client-print-support-files-supported” (see Table 1 - “client-print-support-files-supported” attribute  
221      fields in section 3.1) with the following exceptions:

222

**Table 2 - “client-print-support-files-filter” attribute fields**

Field Name	Field Value in the “client-print-support-files-filter” attribute
uri-scheme	One or more REQUIRED comma-separated LOWER-CASE ‘uriScheme’ string values identifying the uri scheme to be filtered on. <a href="#">Valid values are the string representation of the IPP ‘uriScheme’ attribute syntax (see [RFC2911] section 4.1.6)</a> . Example URI schemes are: ‘ftp’, ‘http’, and ‘ipp’. The Printer SHOULD support the ‘ipp’ scheme. If supplied by the client, this field NEED NOT be first. If this field is omitted by the client, the Printer returns all schemes.
xxx	<a href="#">One or more comma-separated values for any All</a> of the fields <a href="#">defined</a> in Table 1, with the single exception of the “uri” field which a client MUST NOT supply and a Printer MUST NOT support. <a href="#">The Printer MUST support Aany filter field can have having</a> more than one value separated by a COMMA (,), including the fields that Table 1 indicates MUST BE single valued.

223

224 [Printer implementations MUST support the “client-print-support-files-filter” operation attribute in a Get-](#)  
 225 [Printer-Attributes request with the member fields listed Table 3. Printers MAY support any additional filter](#)  
 226 [fields listed in Table 2.](#)

227  
228

[Client implementations MAY supply any filter fields listed in Table 2 in the “client-print-support-files-filter” operation attribute of a Get-Printer-Attributes request.](#)

229

**Table 3 - REQUIRED “client-print-support-files-filter” fields**

<a href="#">uri-scheme</a>
<a href="#">os-type</a>
<a href="#">cpu-type</a>
<a href="#">document-format</a>
<a href="#">natural-language</a>

230

### 231 [\*\*3.2.1.1.1 Filter matching rules\*\*](#)

232 The Printer returns only the values of the “client-print-support-files-supported” Printer Description attribute  
 233 that match the filter in the “client-print-support-files-filter” operation attribute. [The following filter matching](#)  
 234 [rules are defined:](#)

- 235        1. A match occurs if at least one value of each field supplied by the client in the filter matches a Client  
236        Print Support File value. Printers MUST ignore a filter field supplied by a client that the Printer does  
237        not support and return a match if all supported fields do match, no matter what value the client  
238        supplied for that unsupported field. Similarly, Printers MUST ignore a filter field supplied by a client  
239        that the Printer does support, but which the field has not been populated for a Client Print Support  
240        Files and return a match if all supported and populated fields do match, no matter what value the client  
241        supplied for that unpopulated field.
- 242        2. A match for a CASE-INSENSITIVE field occurs independent of the case of the letters supplied by  
243        the client and those stored by the Printer, while a match for a LOWER-CASE field is a strict  
244        character for character match.
- 245        3. A match for a ‘keyword’ Printer field that is populated with the ‘unknown’ special keyword value  
246        occurs for any value supplied by the client for that field.
- 247        4. If the “client-print-support-files-filter” operation attribute filter is not supplied by the client, the printer  
248        shouldSHOULD behave as if the attribute had been provided with all fields left empty (i.e., return an  
249        unfiltered list).

250        The following are two examples of a “client-print-support-files-filter” filter value:

251        os-type=windows-95< cpu-type=x86-32<  
252        document-format=application-postscript< natural-language=en,de<  
253  
254        uri-scheme=ipp< os-type=windows-95< cpu-type=x86-32<  
255        document-format=application-postscript< natural-language=en,de<

256  
257        See section 3.2.2 for example matching in the responses.

258        The IPP Printer is REQUIRED to support this operation attribute and the following member fields in a “client-  
259        print-support-files-filter” operation attribute filter in the Get-Printer-Attributes request:

260        1.uri scheme  
261        2.os type  
262        3.cpu type  
263        4.document format  
264        5.natural language

265        Printer implementations MAY support additional fields and additional values of defined fields. Printers MUST  
266        ignore fields they do not support.

267        It is RECOMMENDED that workstations first use the Get-Printer-Attributes operation in combination with  
268        “client-print-support-files-filter” operation attribute filter to get a list of the potential Client Print Support Files  
269        that meet the workstation’s requirements. The workstation can then choose from the returned list which Client  
270        Print Support Files to use and where to get them. If one of the URIs returned is an IPP uri, the workstation

271 can retrieve the Client Print Support Files from an IPP printer via the Get-Client-Print-Support-Files operation  
272 (see section 3.3).

273 **3.2.2 Get-Printer-Attributes Response**

274 A Printer MUST return the “client-print-support-files-supported” (1setOf octetString(MAX)) attribute in the  
275 Printer Object Attributes group (group 3) when requested by a client. Each returned attribute value  
276 ~~must~~MUST satisfy the criteria specified by the client in the request.

277 For example, if the request contains the following “client-print-support-files-filter” filter:

278 os-type=windows-95< cpu-type=x86-32<  
279 document-format=application-postscript<  
280 natural-language=en,de<

281 A conforming response is the following two octet String values:

282 uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<  
283 os-type=windows-95< cpu-type=x86-32<  
284 document-format=application/postscript<  
285 natural-language=en< compression=gzip<  
286 install-file-type=printer-driver<  
287 client-file-name=CompanyX-ModelY-driver.gz<  
288 policy=manufacturer-recommended<  
289 digital-signature=smime<  
290  
291 uri=ftp://mycompany.com/root/drivers/win95/CompanyX/ModelY.gz<  
292 os-type=windows-95< cpu-type=x86-32<  
293 document-format=application/postscript,application/vnd.hp-PCL<  
294 natural-language=en,fr< compression=gzip<  
295 install-file-type=printer-driver<  
296 client-file-name=CompanyX-ModelY-driver.gz<  
297 policy=manufacturer-recommended<  
298 digital-signature=smime<  
299

300 These examples have been broken onto separate lines for readability in this document. However, there  
301 MUST NOT be any line breaks in the actual values.

302 As another example, if the above request had also contained the “uri-scheme” field in the following “client-  
303 print-support-files-filter” filter:

304 uri-scheme=ipp< os-type=windows-95< cpu-type=x86-32<

305           document-format=application-postscript<  
306           natural-language=en,de<

307        Then only the first value would have been returned as a single octetString value:

308           uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<  
309           os-type=windows-95< cpu-type=x86-32<  
310           document-format=application/postscript<  
311           natural-language=en< compression=gzip<  
312           install-file-type=printer-driver<  
313           client-file-name=CompanyX-ModelY-driver.gz<  
314           policy=manufacturer-recommended<  
315           digital-signature=smime<

### 316     **3.3 Get-Client-Print-Support-Files**

317        This RECOMMENDED operation allows a client to download Client Print Support Files from an IPP Printer.

#### 318     **3.3.1 Get-Client-Print-Support-Files Request**

319        The following sets of attributes are part of the Get-Client-Print-Support-Files request:

320        Group 1: Operation Attributes

321        Natural Language and Character Set:

322        The “attributes-charset” and “attributes-natural-language” attributes as described in [RFC2911],  
323        section 3.1.4.1.

324        Target:

325        The “printer-uri” (uri) operation attribute which is the target for this operation as described in  
326        [RFC2911], section 3.1.5. The client MUST use the URI value as the target of this operation that the  
327        Printer returns in the “uri” field (see Table 1) in the Get-Printer-Attributes response. Furthermore, the  
328        client MUST use the appropriate authorization and security regime for this URI as indicated by the  
329        Printer’s “printer-uri-supported”, “uri-authentication-supported” and “uri-security-supported”  
330        attributes (see [RFC2911] sections 4.4.1, 4.4.2, and 4.4.3). Only if the URI returned in the “uri” field  
331        matches the URI that the client used for the Get-Printer-Attributes request MAY the client use the  
332        same HTTP connection. The ‘ipp’ URL matching rules are defined in [ipp-url] and do not include the  
333        query part.

334        Requesting User Name:

335        The “requesting-user-name” (name(MAX)) attribute SHOULD be supplied by the client as described  
336        in [RFC2911], section 8.3.

337        “client-print-support-files-uriquery” (uritext(127)):

338       The client MUST supply this attribute specifying the [query part \[RFC2396\] of the ipp](#) uri for the  
339       desired Client Print Support Files [not including the “?” character that starts the query part](#), i.e., the  
340       value of the “uri” field [following the “?” character](#) returned by the Get-Printer-Attributes in one of the  
341       values of the “client-print-support-files-supported” (1setOf octetString(MAX)) Printer attribute [\(see](#)  
342       [Table 1\) that had an ‘ipp’ scheme.](#) [The URI scheme must be ipp](#)

343       **Note:** [This uri is neither the Printer’s target “printer-uri” nor the URL in the HTTP header.](#)

344     **3.3.2 Get-Client-Print-Support-Files Response**

345       The Printer object returns the following sets of attributes as part of the Get-Client-Print-Support-Files  
346       Response:

347       **Group 1: Operation Attributes**

348       **Status Message:**

349       In addition to the REQUIRED status code returned in every response, the response OPTIONALY  
350       includes a “status-message” (text(255)) operation attribute as described in [RFC2911], sections 13  
351       and 3.1.6.

352       **Natural Language and Character Set:**

353       The “attributes-charset” and “attributes-natural-language” attributes as described in [RFC2911],  
354       section 3.1.4.2.

356       **Group 2: Unsupported Attributes**

357       See [RFC2911], section 3.1.7 for details on returning Unsupported Attributes.  
358

359       **Group 3: Printer Object Attributes**

360       “client-print-support-files-supported” (octetString(MAX)).

361       This attribute identifies the properties of the returned Client Print Support Files. The Printer object  
362       MUST return this attribute if the response includes Group 4 (i.e., if a set of Client Print Support Files  
363       identified by the supplied “client-print-support-files-[query](#)” [operation attribute](#) was found). The  
364       Printer MUST return [all configured fields for the selected Client Print Support Files in](#) the format  
365       shown in section 3.1.  
366

367       **Group 4: Client Print Support Files**

368       The printer MUST supply the Client Print Support Files that match the client’s criteria following the “end-  
369       of-attributes” tag. All necessary files [must](#)[MUST](#) be compressed into a single [transferred](#) file.

370 **4 Conformance**

371 A Printer conforming to this specification:

- 372 1. MUST support the “client-print-support-files-supported” Printer Description attribute as defined in  
373 section 3.1, including all of the REQUIRED fields defined in Table 1 and MAY support the  
374 OPTIONAL fields defined in Table 1.
- 375 2. MUST support the “client-print-support-files-filter” operation attribute in the Get-Printer-Attributes  
376 request as defined in section 3.2, including all of the fields defined listed in Table 2Table 3 and ignoring  
377 any fields not recognized.
- 378 3. MUST support at least one of the following URI schemes that identify the support files: ‘ftp’, ‘http’, or  
379 ‘ipp’, of which the ‘ipp’ scheme is the RECOMMENDED one.
- 380 4. SHOULD support the Get-Client-Print-Support-Files operation as described in section 3.3. If this  
381 operation is supported, then one of the supported schemes MUST be ‘ipp’.
- 382 5. SHOULD support TLS as described in section 9.
- 383 6. SHOULD support the downloading of Client Print Support Files that have been digitally signed as  
384 described in section 9.

385 A client conforming to this specification:

- 386 1. MUST ignore any fields returned by the Printer in the “client-print-support-files-supported” Printer  
387 Description attribute that the client does not recognize or support.
- 388 2. SHOULD be able to retrieve Client Print Support Files by either ftp-FTP Get or http-HTTP Get  
389 operations.
- 390 3. MUST be able to retrieve Client Print Support Files using the Get-Client-Print-Support-Files  
391 operation, i.e., support the ‘ipp’ scheme.
- 392 4. MUST supply the proper URI value for the “printer-uri” operation attribute as specified in section  
393 3.3.1 under Target:.
- 394 5. MUST validate that files that are supposed to be digitally signed are done with the indicated mechanism  
395 as described in section 9.
- 396 6. SHOULD support TLS as described in section 9.

397 **5 Encoding of the Operation Layer**

398 This extension uses the operation layer encoding described in [RFC2910].

399 6 Encoding of Transport Layer

400 This specification uses the transport layer encoding described in [RFC2910] with the following extensions.

## 401 New Error codes:

402 0x0417 client-error-client-print-support-file-not-found

403 New Operation code

404 0x0021 Get-Client-Print-Support-Files

405 7 IANA Considerations

406 The IANA-registered operating system names that IANA has registered [os-names] are required by this spec  
407 for use in the “os-type” field (see Table 1).

Table 1 of this document defines possible ‘keyword’ values for the “cpu-type” field. The “cpu-type” is not a current IANA registry. The current However, the existing IANA machine registration [cpu-names] is inadequate for two reasons: a) it is really a machine model number, not a CPU type. Also type, and b) it doesn’t express whether a CPU is 16-bit, 32-bit, or 64-bit which needs to be indicated in the CPU name keyword value. which is not currently reflected in the IANA CPU registry. Therefore, the “os-type” field will be a new type of registration with initial values assigned.

The rest of this section contains the exact information for IANA to add to the IPP Registries according to the procedures defined in RFC 2911 [RFC2911] section 6.

*Note to RFC Editors: Replace RFC NNNN below with the RFC number for this document, so that it accurately reflects the content of the information for the IANA Registry.*

418 **7.1 Attribute Registrations**

419     The attributes and fields defined in this document will be published by IANA according to the procedures in  
420     RFC 2911 [RFC2911] section 6.2 with the following path:

421 <ftp://ftp.isi.edu/iana/assignments/ipp/attributes/>

**422** The registry entry will contain the following information:

423 Printer Description Attributes: Ref: Section:  
424 client-print-support-files-supported (1setOf octetString(MAX))  
425  
426

For purposes of IANA attribute registration, the following fields of the "client-print-support-files-supported" and the "client-print-support-files-filter" attributes are registered following the procedures for IPP attribute registration:

	Ref:	Section:
uri (uri)	RFC NNNN	3.1
os-type (type2 keyword)	RFC NNNN	3.1
cpu-type (type2 keyword)	RFC NNNN	3.1
document-format (mimeMediaType)	RFC NNNN	3.1
natural-language (naturalLanguage)	RFC NNNN	3.1
compression (type2 keyword)	RFC NNNN	3.1
file-type (type2 keyword)	RFC NNNN	3.1
client-file-name (name(MAX))	RFC NNNN	3.1
policy (type2 keyword)	RFC NNNN	3.1
file-size (integer(0:MAX))	RFC NNNN	3.1
file-version (name(MAX))	RFC NNNN	3.1
file-date-time (text(25))	RFC NNNN	3.1
file-info (text(127))	RFC NNNN	3.1
digital-signature (type2 keyword)	RFC NNNN	3.1
uri-scheme (uriScheme)	RFC NNNN	3.2

## 7.2 Operation Registrations

The operations defined in this document will be published by IANA according to the procedures in RFC 2911 [RFC2911] section 6.4 with the following path:

[ftp.isi.edu/iana/assignments/ipp/operations/](http://ftp.isi.edu/iana/assignments/ipp/operations/)

The registry entry will contain the following information:

<u>Operations:</u>	Ref.	Section:
Get-Client-Print-Support-Files	RFC NNNN	3.3

## 8 Internationalization Considerations

All text representations introduced by this specification adhere to the internationalization-friendly representation supported by IPP. This work is also accommodates the use of Client Print Support Files of different languages.

## 464 9 Security Considerations

465 The IPP Model and Semantics document [RFC2911] discusses high-level security requirements (Client  
466 Authentication, Server Authentication and Operation Privacy). Client Authentication is the mechanism by  
467 which the client proves its identity to the server in a secure manner. Server Authentication is the mechanism by  
468 which the server proves its identity to the client in a secure manner. Operation Privacy is defined as a  
469 mechanism for protecting operations from eavesdropping.

470 Only operators of a printer ~~should~~ **SHOULD** be allowed to set the “[client-print-support-files](#)~~printer-driver~~-  
471 supported” attribute and only users of the printer ~~should~~ **SHOULD** be allowed to query that information.

472 The IPP extension described in this document introduces the potential for a security threat previously not  
473 encountered by IPP. As Client Print Support Files might exist in the form of executable objects (as is the case  
474 with printer drivers, for example), additional provisions are needed to prevent the distribution of malicious  
475 code through this mechanism. Digital signatures provide the message level security commonly used to help  
476 consumers of network resources verify the authenticity and integrity of those resources. Specifically, digital  
477 signatures help defend against security threats such as message insertion, message deletion, and message  
478 modification, and their combined use into man-in-the-middle attacks.

479 This document identifies some commonly used signing mechanisms (SMIME [RFC2634], PGP [RFC1991],  
480 DSS [dss], and XML Digital Signatures [xmldsig]), though any others MAY be used. Of course, it is assumed  
481 that once end-users know the identity of the provider of Client Print Support Files, they can make the correct  
482 determination as to whether it is safe to use those files.

483 Printers that support the Get-Client-Print-Support-Files operation **SHOULD** support the downloading of  
484 Client Print Support Files that have been digitally signed. Clients that invoke the Get-Client-Print-Support-  
485 Files operation **MUST** make sure that Client Print Support Files that are supposed to be signed (i.e., whose  
486 [client-print-support-files-supported](#) attribute value includes the "digital-signature" field) are indeed signed via  
487 the specified mechanism when downloaded from the printer.

488 Furthermore, printers that support the Get-Client-Print-Support-Files operation **SHOULD** ~~are REQUIRED~~  
489 ~~to implement TLS to provide application level channel security and~~ enable users to reliably authenticate the  
490 source of the Client Print Support Files.
