9 Internet Printing Protocol (IPP):  
10 **Printer Installation Extension**  
11

12 Copyright (C) The Internet Society (2001). All Rights Reserved.

13 Status of this Memo  
14

15 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of  
16 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its  
17 areas, and its working groups. Note that other groups may also distribute working documents as  
18 Internet-Drafts.

19 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced,  
20 or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference  
21 material or to cite them other than as “work in progress”.

22 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>

23 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

24 **Abstract**  
25

26 This document describes an OPTIONAL extension to the Internet Printing Protocol/1.0 (IPP)  
27 [RFC2566, RFC2565] and IPP/1.1 [RFC2911, RFC2910]. Various client platforms require that some  
28 setting up take place at the workstation before the client can properly submit jobs to a specific printer.  
29 This setup process is sometimes referred to as printer installation. Most clients need some information  
30 about the printer being installed as well as support files to complete the printer installation. The nature  
31 of these "Client Print Support Files" varies depending on the specific client platform, from simple  
32 configuration files to highly sophisticated printer drivers. The selection and installation process can be  
33 simplified and even automated if the workstation can learn some key information about the printer and  
34 which sets of Client Print Support Files are available. Such key information includes: operating system  
35 type, CPU type, document-format (PDL), natural language, compression mechanism, file type, client file  
36 name, policy for automatic loading, file size, file version, file date and time, file information description,  
37 and digital signature.

83

## 83 1 Introduction

84 This IPP notification specification is an OPTIONAL extension to Internet Printing Protocol/1.0 (IPP)  
85 [RFC2566, RFC2565] and IPP/1.1 [RFC2911, RFC2910]. See section 13 for a brief description of the  
86 IPP base documents.

87 A common configuration for printing from a workstation requires that some Client Print Support Files  
88 (e.g., PPD, printer driver files) specific to the target printer be installed on that workstation. Selection  
89 and configuration of the appropriate Client Print Support Files can be simplified and even automated if  
90 the workstation can obtain some key information about the printer and which sets of Client Print  
91 Support Files are available. Such key information includes: operating system type, CPU type,  
92 document-format (PDL), natural language, compression mechanism, file type, client file name, policy  
93 for automatic loading, file size, file version, file date and time, file information description, and digital  
94 signature.

95 The OPTIONAL IPP extension defined in this document provides a simple and reliable vehicle for  
96 printers to convey this information to interested workstations. This extension enables a flexible solution  
97 for installing Client Print Support Files on workstations running different operating systems and for  
98 printers of all makes and models. It allows Client Print Support Files to be downloaded from  
99 repositories of different sorts. A possible repository for the files is the printer itself. The extensions  
100 necessary for getting Client Print Support Files from the printer are included in this document, including  
101 security for downloading executable code and data.

## 102 2 Terminology

103 This section defines the following terms that are used throughout this document:

104 This document uses the same terminology as [RFC2911], such as “attribute”, “attribute value”,  
105 “keyword”, “operation”, “request”, “response”, and “support”. In addition, the following terms are  
106 defined for use in this document and the Delivery Method Documents:

107 **Client Print Support Files** - a set of files, such as a printer driver, font metric file, printer configuration  
108 file (PPD, GPD, etc.) that support a client printing to a particular Printer. A Printer MAY have multiple  
109 sets of Client Print Support Files that work for different operating systems, document formats, natural  
110 languages, CPUs, etc.

111 This document uses the same terminology as [RFC2911], such as “client”, “Printer”, “attribute”,  
112 “attribute value”, “keyword”, “operation”, “request”, “response”, and “support”. This document also  
113 uses the terms “IPP Printer”, “Printer” and “Printer object” interchangeably as in [RFC2911] to mean  
114 the software entity that accepts IPP operation requests and returns IPP operation responses (see  
115 [RFC2911] section 2).

116 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT, MAY,  
117 NEED NOT, and OPTIONAL, have special meaning relating to conformance as define in RFC  
118 2119 [RFC2119] and [RFC2911] section 12.1. If an implementation supports the extension

119 defined in this document, then these terms apply; otherwise, they do not. These terms define  
120 conformance to *this document only*; they do not affect conformance to other documents, unless  
121 explicitly stated otherwise.

## 122 3 Model Extensions

123 To assist workstations in the printer installation process, an IPP printer needs to provide the  
124 workstation with information about the Client Print Support Files, such as the their name and location/s.  
125 This information needs to match the workstation's specific environment, such as its operating system,  
126 preferred natural language, and preferred document format.

127 The following extensions to the IPP model enable assisted or automated printer installation. This  
128 section describes each extension in detail.

- 129 - A new REQUIRED Printer Description attribute: "client-print-support-files-supported" (1setOf  
130 octetString(MAX)).
- 131 - A new REQUIRED Get-Printer-Attributes operation attribute: "client-print-support-files-filter"  
132 (octetString(MAX)).
- 133 - A new RECOMMENDED printer operation: Get-Client-Print-Support-Files.

### 134 3.1 client-print-support-files-supported (1setOf octetString(MAX))

135 An IPP Printer uses the REQUIRED Printer Description attribute "client-print-support-files-supported"  
136 to represent relevant information about all of the Client Print Support Files it supports. Each value is a  
137 composite UTF-8 string with well-defined fields (see Table 1). Each value string MUST be formatted  
138 as follows:

139 "uri=val<sub>1</sub>< field-name<sub>2</sub>=val<sub>21</sub>,...,val<sub>2p</sub>< ... < field-name<sub>n</sub>=val<sub>n1</sub>,...,val<sub>nq</sub><"

140 The first field MUST be the "uri" field. The remaining fields MAY be in any order.

141 The string MUST NOT include any control characters (hex 00 to 1F), even the so-called white space  
142 control characters (TAB, CR, and LF) anywhere. Only zero or more UTF-8 SPACE characters (hex  
143 20) can be included and they can be included only IMMEDIATELY AFTER the delimiter character:  
144 "<", but NOT anywhere else, including after "=" and ",". However, if the UTF-8 SPACE character is  
145 needed in a client-file-name value, then each occurrence is included directly, without escaping (see  
146 example). On the other hand, if the UTF-8 SPACE character is needed in a URL value, then each  
147 occurrence is escaped as: "%20" (URI conventions - see [RFC2396]).

148 Table 1 lists the REQUIRED fields that a Printer MUST support and the OPTIONAL fields that a  
149 Printer MAY support in the "client-print-support-files-supported" (1setOf octetString(MAX)) Printer  
150 Description attribute. A Printer implementation MAY support additional fields using the same syntax.  
151 Values are defined to be either CASE-SENSITIVE or ALL-LOWER-CASE according to the  
152 definitions for the attribute syntaxes from [RFC2911] (set off by single quotes in the table). The CASE-  
153 SENSITIVE values MAY have upper and lower case letters as for the corresponding attribute syntaxes

154 in [RFC2911]. The LOWER-CASE values MUST have all lower case alphabetic letters. Additional  
155 characters, such as digits, hyphen-minus (-), period (.), and slash (/) are according to the corresponding  
156 attribute syntaxes in [RFC2911]. Additional values for these fields can be registered with IANA  
157 according to the procedures in [RFC2911] for registering additional values of attributes. Additional  
158 fields can be registered with IANA according to the procedures defined in [RFC2911] for registering  
159 attributes. See section 7.

160 Clients SHOULD ignore fields they don't recognize in a given value. This allows for future extensions  
161 to the format of the string without breaking compatibility with earlier clients.

**Table 1 - “client-print-support-files-supported” attribute fields**

Field name	Field value
“uri”	<p>One REQUIRED CASE-SENSITIVE ‘uri’ string identifying the uri where to obtain the support files for each OS platform, document format, and natural language the printer supports. This MUST be the first field in each value. Examples of uri schemes that MAY be found here are ‘ftp’, ‘http’, and ‘ipp’. The ‘ftp’ and ‘http’ schemed URIs identify the archive file that contains all the necessary client support files.</p> <p>The ‘ipp’ schemed URIs identify the archive file that clients MAY obtain from the Printer using the Get-Client-Print-Support-Files operation (see section 3.3). The URI MUST be a valid URI to the same Printer object, i.e., one of the values of the Printer's "printer-uri-supported" attribute. The ‘ipp’ URI is used to distinguish between multiple Client Print Support Files in an implementation dependent manner using the URL query syntax (e.g., "?drv-id=xxx") [RFC2396]. The query part MUST NOT exceed 127 octets, not counting the “?” character that begins the query part. A Printer SHOULD support the ‘ipp’ scheme.</p>
“os-type”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘keyword’ strings identifying the operating system types supported by this set of Client Print Support Files. Valid values are the operating system names defined in the IANA document [os-names] and the special keyword value: ‘unknown’. Although the IANA registry requires that the names be all upper-case, the values MUST be all lower case in this field (plus hyphen-minus (-), period (.), and slash (/)). Examples: ‘linux’, ‘linux-2.2’, ‘os/2’, ‘sun-os-4.0’, ‘unix’, ‘unix-bsd’, ‘win32’, ‘windows-95’, ‘windows-98’, ‘windows-ce’, ‘windows-nt’, ‘windows-nt-4’, ‘windows-nt-5’, ‘unknown’.</p>
“cpu-type”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘keyword’ strings identifying the CPU types supported by this set of Client Print Support Files. The values indicate the CPU family independent of the CPU manufacturer. Standard keyword values are: ‘x86-16’, ‘x86-32’, ‘x86-64’, ‘dec-vax’, ‘alpha’, ‘power-pc’, ‘m-68000’, ‘sparc’, ‘itanium’, ‘mips’, ‘arm’ and will be used as the initial value for the “cpu-type” IANA registry. In addition, the special keyword value: ‘unknown’ is valid.</p>
“document-format”	<p>One or more REQUIRED comma-separated CASE-SENSITIVE ‘mimeType’ strings identifying the document formats supported by this set of Client Print Support Files. Valid values are the string representation of the IPP mimeType attribute syntax (see [RFC2911] section 4.1.9), for example ‘application/postscript’. In addition, the special keyword value: ‘unknown’ is valid.</p>
“natural-language”	<p>One or more REQUIRED comma-separated LOWER-CASE ‘naturalLanguage’ strings identifying the natural language used by this set of Client Print Support Files. Valid values are the string representation of the IPP ‘naturalLanguage’ attribute syntax (see [RFC2911] section 4.1.8), for example ‘en’ and ‘en-us’. In addition, the special keyword value: ‘unknown’ is valid.</p>

Field name	Field value
"compression"	One REQUIRED LOWER-CASE 'keyword' string identifying the mechanism used to compress this set of Client Print Support Files. All files needed for the installation of a printer driver MUST be compressed into a single file. Valid keyword values are the keywords defined by [RFC2911] or registered with IANA for use in the IPP "compression" and "compression-supported" attributes. See [RFC2911] section 4.4.32), for example 'gzip'. The 'none' value limits the uncompressed Client Print Support File to a single file. The values for the "compression" field that a Printer supports NEED NOT be the same values that the Printer is configured to support in Job Creation operations as indicated in the Printer's "compressions-supported" attribute.
"file-type"	One or more REQUIRED comma-separated LOWER-CASE 'keyword' strings identifying the type of the Client Print Support Files. Standard keyword values are: 'printer-driver', 'ppd', 'updf', 'gpd'.
"client-file-name"	One REQUIRED CASE-SENSITIVE string identifying the name by which the Client Print Support Files will be installed on the workstation. For Client Print Support Files of type 'printer-driver', this is also the name that identifies this printer driver in an .inf file.
"policy"	One OPTIONAL LOWER-CASE 'keyword' string indicating the policy for automatic loading. Standard keyword values are: 'manufacturer-recommended', 'administrator-recommended', 'manufacturer-experimental', 'administrator-experimental'. The experimental values are for beta test.
"file-size"	One OPTIONAL file size in octets represented as ASCII decimal digits.
"file-version"	One OPTIONAL LOWER-CASE version number. Recommended to be of the form "Major.minor[.revision]" where "Major" is the major version number, "minor" is the minor version number and "revision" is an optional revision number.
"file-date-time"	One OPTIONAL File CASE-SENSITIVE creation date and time according to ISO 8601 where all fields are fixed length with leading zeroes (see [RFC2518] Appendix 2). Examples: 2000-01-01T23:09:05Z and 2000-01-01T02:59:59-04.00
"file-info"	One OPTIONAL CASE-SENSITIVE human readable 'text' string describing this set of Client Print Support Files. The natural language for this value MUST be the natural language indicated by the Printer's "natural-language-configured" attribute. To avoid exceeding the maximum limit imposed on IPP attributes and to increase interoperability with other systems, the length of this field value MUST not exceed 127 characters.
"digital-signature"	One REQUIRED LOWER-CASE 'keyword' string identifying the mechanism used to ensure the integrity and authenticity of this set of Client Print Support Files. Standard values are: 'smime', 'pgp', 'dss', and 'xmldsig' which are defined in [RFC2634], [RFC1991], [dss], and [xmldsig], respectively. In addition, the special keyword value: 'none' is valid.

163 Each value MUST refer to one and only one set of Client Print Support Files, even if the files are  
164 downloadable from various repositories (i.e., even if they are associated with multiple URIs).

### 165 3.1.1 Use of Keyword Values in fields

166 A number of the fields in Table 1 use keyword strings as values. The syntax of these keywords is the  
167 same as in [RFC2911], including the use of private keywords. See [RFC2911] sections 4.1.3 and 6.1.  
168 Printer implementers are strongly RECOMMENDED to submit additional keyword values for  
169 registration with IANA according to the procedures for registering attributes. See section 7 and  
170 [RFC2911] section 6.1.

### 171 3.1.2 Use of the Special Keyword Value: 'unknown'

172 A number of REQUIRED 'keyword' value fields have a special keyword value: 'unknown' defined.  
173 This value is intended for use when the actual value is not known, such as by an administrator automatic  
174 software configuring the IPP Printer object. However, it is strongly RECOMMENDED that other  
175 more meaningful values be used, instead of the 'unknown' value whenever possible.

### 176 3.1.3 Examples of "client-print-support-files-supported" attribute values

177 The following illustrates what two valid values of the "client-print-support-files-supported" (1setOf  
178 octetString(MAX)) Printer Description attribute might look like:

```
179 uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<  
180 os-type=windows-95< cpu-type=x86-32<  
181 document-format=application/postscript<  
182 natural-language=en< compression=gzip<  
183 file-type=printer-driver<  
184 client-file-name=CompanyX-ModelY-driver.gz<  
185 policy=manufacturer-recommended<
```

```
187 uri=ftp://mycompany.com/root/drivers/win95/CompanyX/ModelY.gz<  
188 os-type=windows-95< cpu-type=x86-32<  
189 document-format=application/postscript,application/vnd.hp-PCL<  
190 natural-language=en,fr< compression=gzip<  
191 file-type=printer-driver<  
192 client-file-name=Company T Model Z driver.gz<  
193 policy=manufacturer-recommended<
```

194 The above examples have been broken onto separate lines for readability in this document. However,  
195 there MUST NOT be any line breaks in the actual values.

196 The "client-print-support-files-supported" Printer Description attribute MAY be preset at  
197 manufacturing time or through administrative means outside the scope of this document.

## 198 3.2 Get-Printer-Attributes Operation Extension

199 The “client-print-support-files-supported” Printer Description attribute defined in section 3.1 contains  
200 information, such as operating system, natural language, and document format, about *all* of the sets of  
201 Client Print Support Files. This section defines an extension to the Get-Printer-Attributes operation that  
202 allows a workstation to filter out all but the Client Print Support Files of interest.

### 203 3.2.1 Get-Printer-Attributes Request

204 A Printer MAY contain information about multiple sets of Client Print Support Files to match the  
205 different operating systems, natural languages and document formats it supports. A workstation MAY  
206 query this information by including the ‘client-print-support-files-supported’ keyword as a value of the  
207 “requested-attributes” operation attribute of the Get-Printer-Attributes operation.

#### 208 3.2.1.1 client-print-support-files-filter (octetString(MAX)) operation attribute

209 The client can request a subset of the values of the “client-print-support-files-supported” Printer  
210 attribute by supplying the “client-print-support-files-filter” (octetString(MAX)) operation attribute in  
211 the request as a filter. The filter value indicates in which Client Print Support Files the client is  
212 interested. The client MAY supply this attribute. The Printer MUST support this attribute.

213 The filter value of the “client-print-support-files-filter” attribute is a composite string with the same  
214 format as that of “client-print-support-files-supported” (see Table 1 - “client-print-support-files-  
215 supported” attribute fields in section 3.1) with the following exceptions:

216

**Table 2 - “client-print-support-files-filter” attribute fields**

Field Name	Field Value in the “client-print-support-files-filter” attribute
uri-scheme	One or more comma-separated LOWER-CASE ‘uriScheme’ string values identifying the uri scheme to be filtered on. Valid values are the string representation of the IPP ‘uriScheme’ attribute syntax (see [RFC2911] section 4.1.6). Example URI schemes are: ‘ftp’, ‘http’, and ‘ipp’. The Printer SHOULD support the ‘ipp’ scheme. If supplied by the client, this field NEED NOT be first. If this field is omitted by the client, the Printer returns all schemes.
xxx	One or more comma-separated values for any of the fields defined in Table 1, with the single exception of the “uri” field which a client MUST NOT supply and a Printer MUST NOT support.  The Printer MUST support any filter field having more than one value separated by a COMMA (,), including the fields that Table 1 indicates MUST BE single valued.

217

218

219

220

Printer implementations MUST support the “client-print-support-files-filter” operation attribute in a Get-Printer-Attributes request with the member fields listed Table 3. Printers MAY support any additional filter fields listed in Table 2.

221

222

Client implementations MAY supply any filter fields listed in Table 2 in the “client-print-support-files-filter” operation attribute of a Get-Printer-Attributes request.

223

**Table 3 - REQUIRED “client-print-support-files-filter” fields**

uri-scheme
os-type
cpu-type
document-format
natural-language

224

### 225 3.2.1.1.1 Filter matching rules

226

227

228

The Printer returns only the values of the “client-print-support-files-supported” Printer Description attribute that match the filter in the “client-print-support-files-filter” operation attribute. The following filter matching rules are defined:

229

230

231

232

1. A match occurs if at least one value of each field supplied by the client in the filter matches a Client Print Support File value. Printers MUST ignore a filter field supplied by a client that the Printer does not support and return a match if all supported fields do match, no matter what value the client supplied for that unsupported field. Similarly, Printers MUST ignore a filter

- 233 field supplied by a client that the Printer does support, but which the field has not been  
234 populated for a Client Print Support Files and return a match if all supported and populated  
235 fields do match, no matter what value the client supplied for that unpopulated field.
- 236 2. A match for a CASE-INSENSITIVE field occurs independent of the case of the letters supplied  
237 by the client and those stored by the Printer, while a match for a LOWER-CASE field is a strict  
238 character for character match.
- 239 3. A match for a 'keyword' Printer field that is populated with the 'unknown' special keyword  
240 value occurs for *any* value supplied by the client for that field.
- 241 4. If the "client-print-support-files-filter" operation attribute filter is not supplied by the client, the  
242 printer SHOULD behave as if the attribute had been provided with all fields left empty (i.e.,  
243 return an unfiltered list).

244 The following are two examples of a "client-print-support-files-filter" filter value:

```
245 os-type=windows-95< cpu-type=x86-32<  
246 document-format=application-postscript< natural-language=en,de<  
247  
248 uri-scheme=ipp< os-type=windows-95< cpu-type=x86-32<  
249 document-format=application-postscript< natural-language=en,de<  
250
```

251 See section 3.2.2 for example matching responses.

252 It is RECOMMENDED that workstations first use the Get-Printer-Attributes operation in combination  
253 with "client-print-support-files-filter" operation attribute filter to get a list of the potential Client Print  
254 Support Files that meet the workstation's requirements. The workstation can then choose from the  
255 returned list which Client Print Support Files to use and where to get them. If one of the URIs returned  
256 is an IPP uri, the workstation can retrieve the Client Print Support Files from an IPP printer via the Get-  
257 Client-Print-Support-Files operation (see section 3.3).

### 258 3.2.2 Get-Printer-Attributes Response

259 A Printer MUST return the "client-print-support-files-supported" (1setOf octetString(MAX)) attribute  
260 in the Printer Object Attributes group (Group 3) when requested by a client, unless there are no  
261 matches, in which case the attribute is not returned in Group 3. Each returned attribute value MUST  
262 satisfy the criteria specified by the client in the request.

263 For example, if the request contains the following "client-print-support-files-filter" filter:

```
264 os-type=windows-95< cpu-type=x86-32<  
265 document-format=application-postscript<  
266 natural-language=en,de<
```

267 A conforming response is the following two octet String values:

```
268 uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<
269 os-type=windows-95< cpu-type=x86-32<
270 document-format=application/postscript<
271 natural-language=en< compression=gzip<
272 file-type=printer-driver<
273 client-file-name=CompanyX-ModelY-driver.gz<
274 policy=manufacturer-recommended<
275 digital-signature=smime<
276
277 uri=ftp://mycompany.com/root/drivers/win95/CompanyX/ModelY.gz<
278 os-type=windows-95< cpu-type=x86-32<
279 document-format=application/postscript,application/vnd.hp-PCL<
280 natural-language=en,fr< compression=gzip<
281 file-type=printer-driver<
282 client-file-name=CompanyX-ModelY-driver.gz<
283 policy=manufacturer-recommended<
284 digital-signature=smime<
285
```

286 These examples have been broken onto separate lines for readability in this document. However, there  
287 MUST NOT be any line breaks in the actual values.

288 As another example, if the above request had also contained the “uri-scheme” field in the following  
289 “client-print-support-files-filter” filter:

```
290 uri-scheme=ipp< os-type=windows-95< cpu-type=x86-32<
291 document-format=application-postscript<
292 natural-language=en,de<
```

293 Then only the first value would have been returned as a single octetString value:

```
294 uri=ipp://mycompany.com/myprinter?drv-id=ModelY.gz<
295 os-type=windows-95< cpu-type=x86-32<
296 document-format=application/postscript<
297 natural-language=en< compression=gzip<
298 file-type=printer-driver<
299 client-file-name=CompanyX-ModelY-driver.gz<
300 policy=manufacturer-recommended<
301 digital-signature=smime<
```

### 302 3.3 Get-Client-Print-Support-Files

303 This RECOMMENDED operation allows a client to download Client Print Support Files from an IPP  
304 Printer.

### 305 **3.3.1 Get-Client-Print-Support-Files Request**

306 The following sets of attributes are part of the Get-Client-Print-Support-Files request:

307 Group 1: Operation Attributes

308 Natural Language and Character Set:

309 The “attributes-charset” and “attributes-natural-language” attributes as described in [RFC2911],  
310 section 3.1.4.1.

311 Target:

312 The “printer-uri” (uri) operation attribute which is the target for this operation as described in  
313 [RFC2911], section 3.1.5. The client MUST use the URI value as the target of this operation  
314 that the Printer returns in the “uri” field (see Table 1) in the Get-Printer-Attributes response.  
315 Furthermore, the client MUST use the appropriate authorization and security mechanism for this  
316 URI as indicated by the Printer’s “printer-uri-supported”, “uri-authentication-supported” and  
317 “uri-security-supported” attributes (see [RFC2911] sections 4.4.1, 4.4.2, and 4.4.3). Only if the  
318 URI returned in the “uri” field matches the URI that the client used for the Get-Printer-  
319 Attributes request MAY the client use the same HTTP connection. The ‘ipp’ URL matching  
320 rules are defined in [ipp-url] and do not include the query part.

321 Requesting User Name:

322 The “requesting-user-name” (name(MAX)) attribute SHOULD be supplied by the client as  
323 described in [RFC2911], section 8.3.

324 “client-print-support-files-query” (text(127)):

325 The client MUST supply this attribute specifying the query part [RFC2396] of the ipp uri for the  
326 desired Client Print Support Files not including the “?” character that starts the query part, i.e.,  
327 the value of the “uri” field following the “?” character returned by the Get-Printer-Attributes in  
328 one of the values of the “client-print-support-files-supported” (1setOf octetString(MAX))  
329 Printer attribute (see Table 1) that had an ‘ipp’ scheme. If the Printer does not find any Client  
330 Print Support Files which match the query, the Printer MUST reject this request with a ‘client-  
331 error-client-print-support-file-not-found’ status code (see section 10.1).

### 332 **3.3.2 Get-Client-Print-Support-Files Response**

333 The Printer object returns the following sets of attributes as part of the Get-Client-Print-Support-Files  
334 Response:

335 Group 1: Operation Attributes

336 Status Message:

337 In addition to the REQUIRED status code returned in every response, the response  
 338 OPTIONALLY includes a “status-message” (text(255)) operation attribute as described in  
 339 [RFC2911], sections 13 and 3.1.6.

340 Natural Language and Character Set:  
 341 The “attributes-charset” and “attributes-natural-language” attributes as described in [RFC2911],  
 342 section 3.1.4.2.

344 Group 2: Unsupported Attributes

345 See [RFC2911], section 3.1.7 for details on returning Unsupported Attributes.  
 346

347 Group 3: Printer Object Attributes

348 “client-print-support-files-supported” (octetString(MAX)).

349 This attribute identifies the properties of the returned Client Print Support Files. The Printer  
 350 object MUST return this attribute if the response includes Group 4 (i.e., if a set of Client Print  
 351 Support Files identified by the supplied “client-print-support-files-query” operation attribute was  
 352 found). The Printer MUST return all configured fields for the selected Client Print Support Files  
 353 in the format shown in section 3.1.  
 354

355 Group 4: Client Print Support Files

356 The printer MUST supply the Client Print Support Files that match the client’s criteria following the  
 357 “end-of-attributes” tag, same as for the Print-Job request. All necessary files MUST be compressed  
 358 into a single transferred file.

## 359 4 New Values for Existing Printer Description Attributes

360 The following “operation-id” value is added in order to support the new operation defined in this  
 361 document:

362 **Table 4 – Operation-id assignments**

Value	Operation Name
0x0021	Get-Client-Print-Support-Files

363

## 364 5 Conformance

### 365 5.1 Printer Conformance Requirements

366 A Printer conforming to this specification:

- 367 1. MUST support the “client-print-support-files-supported” Printer Description attribute as defined  
368 in section 3.1, including all of the REQUIRED fields defined in Table 1 and MAY support the  
369 OPTIONAL fields defined in Table 1.
- 370 2. MUST support the “client-print-support-files-filter” operation attribute in the Get-Printer-  
371 Attributes request as defined in section 3.2, including all of the fields listed in Table 3 and  
372 ignoring any fields not recognized.
- 373 3. MUST support at least one of the following URI schemes that identify the support files: ‘ftp’,  
374 ‘http’, or ‘ipp’, of which the ‘ipp’ scheme is the RECOMMENDED one.
- 375 4. SHOULD support the Get-Client-Print-Support-Files operation as described in section 3.3. If  
376 this operation is supported, then one of the supported schemes MUST be ‘ipp’.
- 377 5. SHOULD support TLS as described in section 9.
- 378 6. SHOULD support at least one method for the downloading of Client Print Support Files that  
379 have been digitally signed as described in section 9.

## 380 5.2 Client Conformance Requirements

381 A client conforming to this specification:

- 382 1. MUST ignore any fields returned by the Printer in the “client-print-support-files-supported”  
383 Printer Description attribute that the client does not recognize or support.
- 384 2. SHOULD be able to retrieve Client Print Support Files by either FTP Get or HTTP Get  
385 operations.
- 386 3. MUST be able to retrieve Client Print Support Files using the Get-Client-Print-Support-Files  
387 operation, i.e., support the ‘ipp’ scheme.
- 388 4. MUST supply the proper URI value for the “printer-uri” operation attribute as specified in  
389 section 3.3.1 under Target:.
- 390 5. MUST validate that files that are supposed to be digitally signed are done with the indicated  
391 mechanism as described in section 9.
- 392 6. SHOULD support TLS as described in section 9.

## 393 6 Encoding of the Operation Layer

394 This extension uses the operation layer encoding described in [RFC2910].

395

## 396 7 IANA Considerations

397 The IANA-registered operating system names that IANA has registered [os-names] are required by this  
398 spec for use in the “os-type” field (see Table 1).

399 Table 1 of this document defines possible ‘keyword’ values for the “cpu-type” field. However, the  
400 existing IANA machine registration [cpu-names] is inadequate for two reasons: a) it is really a machine  
401 model number, not a CPU type, and b) it doesn't express whether a CPU is 16-bit, 32-bit, or 64-bit  
402 which needs to be indicated in the keyword value. Therefore, the “os-type” field will be a new  
403 registration with initial values assigned.

404 Implementers may register additional values for the fields defined in Table 1 with IANA according to  
405 the procedures in [RFC2911] for registering additional values of attributes. Implementers may register  
406 additional fields with IANA according to the procedures defined in [RFC2911] for registering attribute  
407 values, even though fields are more like attributes (see section 7.2.1).

408 The rest of this section contains the registration information for IANA to add to the various IPP  
409 Registries according to the procedures defined in RFC 2911 [RFC2911] section 6 to cover the  
410 definitions in this document.

411 *Note to RFC Editors: Replace RFC NNNN below with the RFC number for this document, so that it*  
412 *accurately reflects the content of the information for the IANA Registry.*

### 413 7.1 Attribute Registrations

414 The following table lists all attributes and fields defined in this document. These are to be registered  
415 according to the procedures in RFC 2911 [RFC2911] section 6.2.

416	Printer Description Attributes:	Ref:	Section:
417	client-print-support-files-supported (1setOf octetString(MAX))		
418		RFC NNNN	3.1

419			
420	Operation Attributes:	Ref:	Section:
421	client-print-support-files-filter (octetString(MAX))	RFC NNNN	3.2
422			

423 The resulting attribute registrations will be published in the  
424 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attributes/>  
425 area.  
426

### 427 7.2 Additional Attribute Value Registrations for existing attributes

428 This section lists additional attribute value registrations for use with existing attributes defined in other  
429 documents.

### 430 7.2.1 Additional values for the “client-print-support-files-xxx” attributes

431 The following table lists the fields defined in this document for use with the “client-print-support-files-  
 432 supported” Printer Description (defined in section ) attribute and the “client-print-support-files-filter”  
 433 operation attribute (defined in section ). For purposes of IANA registration, the following fields are  
 434 registered according to the attribute value procedures in RFC 2911 [RFC2911] section 6.1, even though  
 435 they are more like attributes and have an attribute syntax and string values.

436	field Attribute Values:	Ref:	Section:
437	os-type (type2 keyword)	RFC NNNN	3.1
438	cpu-type (type2 keyword)	RFC NNNN	3.1
439	document-format (mimeMediaType)	RFC NNNN	3.1
440	natural-language (naturalLanguage)	RFC NNNN	3.1
441	compression (type2 keyword)	RFC NNNN	3.1
442	file-type (type2 keyword)	RFC NNNN	3.1
443	client-file-name (name(MAX))	RFC NNNN	3.1
444	policy (type2 keyword)	RFC NNNN	3.1
445	file-size (integer(0:MAX))	RFC NNNN	3.1
446	file-version (name(MAX))	RFC NNNN	3.1
447	file-date-time (text(25))	RFC NNNN	3.1
448	file-info (text(127))	RFC NNNN	3.1
449	digital-signature (type2 keyword)	RFC NNNN	3.1
450			

451 The resulting URI scheme attribute value registration will be published in the  
 452 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attribute-values/client-print-support-files-supported/>  
 453 [AND](#)  
 454 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attribute-values/client-print-support-files-filter/>  
 455 areas.  
 456

457	uri (uri)	RFC NNNN	3.1
-----	-----------	----------	-----

460 The resulting URI scheme attribute value registration will be published in the  
 461 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attribute-values/client-print-support-files-supported/>  
 462 area.

463	uri-scheme (uriScheme)	RFC NNNN	3.2
-----	------------------------	----------	-----

466 The resulting URI scheme attribute value registration will be published in the  
 467 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attribute-values/client-print-support-files-filter/>  
 468 area.  
 469

### 470 7.2.2 Additional values for the “operations-supported” Printer attribute

471 The following table lists the enum attribute value defined in this document as an additional type2 enum  
 472 value for use with the “operations-supported” Printer attribute defined in [RFC2911]. This is to be  
 473 registered according to the procedures in RFC 2911 [RFC2911] section 6.1.

474	type2 enum Attribute Values:	Value	Ref.	Section:
475	Get-Client-Print-Support-Files	0x0021	RFC NNNN	4

476

477 The resulting enum attribute value registration will be published in the  
 478 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/attribute-values/operations-supported/>  
 479 area.  
 480

### 481 7.3 Operation Registrations

482 The following table lists the operation defined in this document. This is to be registered according to  
 483 the procedures in RFC 2911 [RFC2911] section 6.4.

484	Operations:	Ref.	Section:
485	Get-Client-Print-Support-Files	RFC NNNN	3.3

486

487 The resulting operation registration will be published in the  
 488 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/operations/>  
 489 area.

### 490 7.4 Status Code Registrations

491 The following table lists the status code defined in this document. This is to be registered according to  
 492 the procedures in RFC 2911 [RFC2911] section 6.6.

493	Status codes:	Ref.	Section:
494	client-error-client-print-support-file-not-found (0x0417)	RFC NNNN	10.1

496

497 The resulting status code registration will be published in the  
 498 <ftp://ftp.iana.org/in-notes/iana/assignments/ipp/status-codes/>  
 499 area.  
 500

## 501 8 Internationalization Considerations

502 All text representations introduced by this specification adhere to the internationalization-friendly  
 503 representation supported by IPP. This work is also accommodates the use of Client Print Support Files  
 504 of different languages.

## 505 9 Security Considerations

506 The IPP Model and Semantics document [RFC2911] discusses high-level security requirements (Client  
 507 Authentication, Server Authentication and Operation Privacy). Client Authentication is the mechanism  
 508 by which the client proves its identity to the server in a secure manner. Server Authentication is the

509 mechanism by which the server proves its identity to the client in a secure manner. Operation Privacy is  
510 defined as a mechanism for protecting operations from eavesdropping.

511 Only operators of a printer SHOULD be allowed to set the “client-print-support-files-supported”  
512 attribute and only users of the printer SHOULD be allowed to query that information.

513 The IPP extension described in this document introduces the potential for a security threat previously  
514 not encountered by IPP. As Client Print Support Files might exist in the form of executable objects (as  
515 is the case with printer drivers, for example), additional provisions are needed to prevent the distribution  
516 of malicious code through this mechanism. Digital signatures provide the message level security  
517 commonly used to help consumers of network resources verify the authenticity and integrity of those  
518 resources. Specifically, digital signatures help defend against security threats such as message insertion,  
519 message deletion, and message modification, and their combined use into man-in-the-middle attacks.

520 This document identifies some commonly used signing mechanisms (SMIME [RFC2634], PGP  
521 [RFC1991], DSS [dss], and XML Digital Signatures [xmldsig]), though any others MAY be used. Of  
522 course, it is assumed that once end-users know the identity of the provider of Client Print Support Files,  
523 they can make the correct determination as to whether it is safe to use those files.

524 Printers that support the Get-Client-Print-Support-Files operation SHOULD support the downloading  
525 of Client Print Support Files that have been digitally signed. Clients that invoke the Get-Client-Print-  
526 Support-Files operation MUST make sure that Client Print Support Files that are supposed to be signed  
527 (i.e., whose client-print-support-files-supported attribute value includes the "digital-signature" field) are  
528 indeed signed via the specified mechanism when downloaded from the printer.

529 Furthermore, printers that support the Get-Client-Print-Support-Files operation SHOULD implement  
530 TLS to provide application level channel security and enable users to reliably authenticate the source of  
531 the Client Print Support Files.

## 532 **10 Status Code Extensions**

533 The following status code is defined as an extension for Notification and is returned as the value of the  
534 “status-code” parameter in the Operation Attributes Group of a response (see [RFC2911] section  
535 3.1.6.1).

### 536 **10.1 client-error-client-print-support-file-not-found (0x0417)**

537 The Printer was unable to match the query in the Get-Client-Print-Support-Files request with any Client  
538 Print Support Files. This status code is not used with the Get-Printer-Attributes operation.

630 Implementers of this specification document are encouraged to join the IPP Mailing List in order to  
631 participate in any discussions of clarification issues and review of registration proposals for additional  
632 attributes and values. In order to reduce spam the mailing list rejects mail from non-subscribers, so you  
633 must subscribe to the mailing list in order to send a question or comment to the mailing list.

## 634 **13 Description of the Base IPP Documents**

635 The base set of IPP documents includes:

636 Design Goals for an Internet Printing Protocol [RFC2567]  
637 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]  
638 Internet Printing Protocol/1.1: Model and Semantics [RFC2911]  
639 Internet Printing Protocol/1.1: Encoding and Transport [RFC2910]  
640 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]  
641 Mapping between LPD and IPP Protocols [RFC2569]  
642

643 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed  
644 printing functionality, and it enumerates real-life scenarios that help to clarify the features that need to  
645 be included in a printing protocol for the Internet. It identifies requirements for three types of users:  
646 end users, operators, and administrators. It calls out a subset of end user requirements that are satisfied  
647 in IPP/1.0 [RFC2566, RFC2565]. A few OPTIONAL operator operations have been added to IPP/1.1  
648 [RFC2911, RFC2910].

649 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document  
650 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of

651 IPP specification documents, and gives background and rationale for the IETF working group's major  
652 decisions.

653 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the  
654 abstract operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It defines  
655 the encoding rules for a new Internet MIME media type called "application/ipp". This document also  
656 defines the rules for transporting a message body over HTTP whose Content-Type is "application/ipp".  
657 This document defines the 'ipp' scheme for identifying IPP printers and jobs.

658 The "Internet Printing Protocol/1.1: Implementer's Guide" document gives insight and advice to  
659 implementers of IPP clients and IPP objects. It is intended to help them understand IPP/1.1 and some  
660 of the considerations that may assist them in the design of their client and/or IPP object  
661 implementations. For example, a typical order of processing requests is given, including error checking.  
662 Motivation for some of the specification decisions is also included.

663 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of  
664 gateways between IPP and LPD (Line Printer Daemon) implementations.
