13 Status of this Memo

14 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of
15 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its
16 areas, and its working groups. Note that other groups may also distribute working documents as
17 Internet-Drafts.

18 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced,
19 or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference
20 material or to cite them other than as "work in progress".

21 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

22 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

23 Abstract

24 This document is one of a set of documents, which together describe all aspects of a new Internet
25 Printing Protocol (IPP). IPP is an application level protocol that can be used for distributed printing
26 using Internet tools and technologies. This document contains information that supplements the IPP
27 Model and Semantics [RFC2911] and the IPP Transport and Encoding [RFC2910] documents. It is
28 intended to help implementers understand IPP/1.1, as well as IPP/1.0 [[RFC2565](#), [RFC2566](#)], and some
29 of the considerations that may assist them in the design of their client and/or IPP object
30 implementations. For example, a typical order of processing requests is given, including error checking.
31 Motivation for some of the specification decisions is also included.

32 This document obsoletes RFC 2639 which was the Implementer's Guide for IPP/1.0.

33

33 ~~The full set of IPP documents includes:~~

34 ~~Design Goals for an Internet Printing Protocol [RFC2567]~~

35 ~~Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]~~

36 ~~Internet Printing Protocol/1.1: Model and Semantics [RFC2911]~~

37 ~~Internet Printing Protocol/1.1: Encoding and Transport [RFC2910]~~

38 ~~Mapping between LPD and IPP Protocols [RFC2569]~~

39 ~~The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed~~
40 ~~printing functionality, and it enumerates real-life scenarios that help to clarify the features that need to~~
41 ~~be included in a printing protocol for the Internet. It identifies requirements for three types of users:~~
42 ~~end users, operators, and administrators. The design goal document calls out a subset of end user~~
43 ~~requirements that are satisfied in IPP/1.1. Operator and administrator requirements are out of scope for~~
44 ~~version 1.1.~~

45 ~~The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol",~~
46 ~~describes IPP from a high-level view, defines a roadmap for the various documents that form the suite of~~
47 ~~IPP specifications, and gives background and rationale for the IETF working group's major decisions.~~

48 ~~The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model~~
49 ~~with abstract objects, their attributes, and their operations. The model introduces a Printer and a Job.~~
50 ~~The Job supports multiple documents per Job. The model document also addresses how security,~~
51 ~~internationalization, and directory issues are addressed.~~

52 ~~The document, "Internet Printing Protocol/1.1: Encoding and Transport", is a formal mapping of the~~
53 ~~abstract operations and attributes defined in the model document onto HTTP/1.1. It also defines the~~
54 ~~encoding rules for a new Internet media type called "application/ipp".~~

55 ~~The document, "Mapping between LPD and IPP Protocols", gives some advice to implementers of~~
56 ~~gateways between IPP and LPD (Line Printer Daemon) implementations.~~

187

188 1 Introduction

189 The IPP Implementer's Guide (IIG) (this document) contains information that supplements the IPP
190 Model and Semantics [RFC2911] and the IPP Transport and Encoding [RFC2910] documents. This
191 document is just one of a suite of documents that fully define IPP. The base set of IPP documents
192 includes:

193 [Design Goals for an Internet Printing Protocol \[RFC2567\]](#)
194 [Rationale for the Structure and Model and Protocol for the Internet Printing Protocol \[RFC2568\]](#)
195 [Internet Printing Protocol/1.1: Model and Semantics \[RFC2911\]](#)
196 [Internet Printing Protocol/1.1: Encoding and Transport \[RFC2910\]](#)
197 [Internet Printing Protocol/1.1: Implementer's Guide \(this document\)](#)
198 [Mapping between LPD and IPP Protocols \[RFC2569\]](#)

199
200 See section 10 for a description of these base IPP documents. Anyone reading these documents for the
201 first time is strongly encouraged to read the IPP documents in the above order.

202 As such ~~the~~ is information in this document is not part of the formal specifications of IPP/1.1. Instead
203 information is presented to help implementers understand ~~the specification~~ IPP/1.1, as well as IPP/1.0
204 [RFC2565, RFC2566], including some of the motivation for decisions taken by the committee in
205 developing the specification. Some of the implementation considerations are intended to help
206 implementers design their client and/or IPP object implementations. If there are any contradictions
207 between this document and [RFC2911] or [RFC2910], those documents take precedence over this
208 document.

209 Platform-specific implementation considerations will be included in this guide as they become known.

210 Note: In order to help the reader of the IIG and the IPP Model and Semantics document, the sections
211 in this document parallel the corresponding sections in the Model document and are numbered the same
212 for ease of cross reference. The sections that correspond to the IPP Transport and Encoding are
213 correspondingly offset.

214 1.1 Conformance language

215 Usually, this document does not contain the terminology MUST, MUST NOT, MAY, NEED NOT,
216 SHOULD, SHOULD NOT, REQUIRED, and OPTIONAL. However, when those terms do appear in
217 this document, their intent is to repeat what the [RFC2911] and [RFC2910] documents require and
218 allow, rather than specifying additional conformance requirements. These terms are defined in section
219 13 on conformance terminology in [RFC2911], most of which is taken from RFC 2119 [RFC2119].

220 Implementers should read section 13 (APPENDIX A) in [RFC2911] in order to understand these
221 capitalized words. The words MUST, MUST NOT, and REQUIRED indicate what implementations
222 are required to support in a client or IPP object in order to be conformant to [RFC2911] and
223 [RFC2910]. MAY, NEED NOT, and OPTIONAL indicate was is merely allowed as an implementer
224 option. The verbs SHOULD and SHOULD NOT indicate suggested behavior, but which is not
225 required or disallowed, respectively, in order to conform to the specification.

226 1.2 Other terminology

227 The term "sender" refers to the client that sends a request or an IPP object that returns a response. The
228 term "receiver" refers to the IPP object that receives a request and to a client that receives a response.

229 1.3 Issues Raised from Interoperability Testing Events

230 The IPP WG has conducted three open Interoperability Testing Events. The first one was held in
231 September 1998, the second one was held in March 1999, and the third one was held in October 2000.
232 See the summary reports in:

233 ftp://ftp.pwg.org/pub/pwg/ipp/new_TES/

234 The issues raised from the first Interoperability Testing Event are numbered 1.n in this document and
235 have been incorporated into "IPP/1.0 Model and Semantics" [RFC2566] and the "IPP/1.0 Encoding and
236 Transport" [RFC2565] documents. However, some of the discussion is left here in the Implementer's
237 Guide to help understanding.

238 The issues raised from the second Interoperability Testing Event are numbered 2.n in this document
239 have been incorporated into "IPP/1.1 Model and Semantics" [RFC2911] and the "IPP/1.1 Encoding and
240 Transport" [RFC2910] documents. However, some of the discussion is left here in the Implementer's
241 Guide to help understanding.

242 The issues raised from the third Interoperability Testing Event are numbered 3.n in this document and
243 are described in:

244 <ftp://ftp.pwg.org/pub/pwg/ipp/Issues/Issues-raised-at-Bake-Off3.pdf>

245 <ftp://ftp.pwg.org/pub/pwg/ipp/Issues/Issues-raised-at-Bake-Off3.doc>

246 <ftp://ftp.pwg.org/pub/pwg/ipp/Issues/Issues-raised-at-Bake-Off3.txt>

247 2 IPP Objects

248 The term "client" in IPP is intended to mean any client that issues IPP operation requests and accepts
249 IPP operation responses, whether it be a desktop or a server. In other words, the term "client" does not
250 just mean end-user clients, such as those associated with desktops.

251 The term "IPP Printer" in IPP is intended to mean an object that accepts IPP operation requests and
252 returns IPP operation responses, whether implemented in a server or a device. An IPP Printer object
253 MAY, if implemented in a server, turn around and forward received jobs (and other requests) to other
254 devices and print servers/services, either using IPP or some other protocol.

255

255 **3 IPP Operations**

256 This section corresponds to Section 3 "IPP Operations" in the IPP/1.1 Model and Semantics document
257 [RFC2911].

258 **3.1 Common Semantics**

259 This section discusses semantics common to all operations.

260 **3.1.1 Summary of Operation Attributes**

261 Legend for the following table:

262 R indicates a REQUIRED operation that MUST be supported by the IPP object (Printer or Job).

263 For attributes, R indicates that the attribute MUST be supported by the IPP object if the IPP object
264 supports the associated operation. |

265 O indicates an OPTIONAL operation or attribute that MAY be supported by the IPP object (Printer
266 or Job).

267 + indicates that this is not an IPP/1.0 feature, but is only a part of IPP/1.1 and future versions of IPP.

268

Table 1 - Summary of Printer operation attributes that sender MUST supply

Operation Attributes	Printer Operations						
	Requests						Responses
	Print-Job, Validate-Job (R)	Print-URI (O)	Create-Job (O)	Get-Printer-Attributes (R)	Get-Jobs (R)	Pause-Printer, Resume-Printer, Purge-Printer (O+)	All Operations
Operation parameters--REQUIRED to be supplied by the sender:							
operation-id	R	R	R	R	R	R	
status-code							R
request-id	R	R	R	R	R	R	R
version-number	R	R	R	R	R	R	R
Operation attributes--REQUIRED to be supplied by the sender:							
attributes-charset	R	R	R	R	R	R	R
attributes-natural-language	R	R	R	R	R	R	R

280

281

281

282 **3.1.2 Suggested Operation Processing Steps for IPP Objects**

283 This section suggests the steps and error checks that an IPP object MAY perform when processing
284 requests and returning responses. An IPP object MAY perform some or all of the error checks.
285 However, some implementations MAY choose to be more forgiving than the error checks shown here,
286 in order to be able to accept requests from non-conforming clients. Not performing all of these error
287 checks is a so-called "forgiving" implementation. On the other hand, clients that successfully submit
288 requests to IPP objects that do perform all the error checks will be more likely to be able to interoperate
289 with other IPP object implementations. Thus an implementer of an IPP object needs to decide whether
290 to be a "forgiving" or a "strict" implementation. Therefore, the error status codes returned may differ
291 between implementations. Consequentially, client SHOULD NOT expect exactly the error code
292 processing described in this section.

293 When an IPP object receives a request, the IPP object either accepts or rejects the request. In order to
294 determine whether or not to accept or reject the request, the IPP object SHOULD execute the
295 following steps. The order of the steps may be rearranged and/or combined, including making one or
296 multiple passes over the request.

297 A client MUST supply requests that would pass all of the error checks indicated here in order to be a
298 conforming client. Therefore, a client SHOULD supply requests that are conforming, in order to avoid
299 being rejected by some IPP object implementations and/or risking different semantics by different
300 implementations of forgiving implementations. For example, a forgiving implementation that accepts
301 multiple occurrences of the same attribute, rather than rejecting the request might use the first
302 occurrences, while another might use the last occurrence. Thus such a non-conforming client would get
303 different results from the two forgiving implementations.

304 In the following, processing continues step by step until a "RETURNS the xxx status code ..."
305 statement is encountered. Error returns are indicated by the verb: "REJECTS". Since clients have
306 difficulty getting the status code before sending all of the document data in a Print-Job request, clients
307 SHOULD use the Validate-Job operation before sending large documents to be printed, in order to
308 validate whether the IPP Printer will accept the job or not.

309 It is assumed that security authentication and authorization has already taken place at a lower layer.

310

310 **3.1.2.1 Suggested Operation Processing Steps for all Operations**

311 This section is intended to apply to all operations. The next section contains the additional steps for the
 312 Print-Job, Validate-Job, Print-URI, Create-Job, Send-Document, and Send-URI operations that create
 313 jobs, adds documents, and validates jobs.

314	IIG Sect #	Flow	IPP error status codes
315	-----	----	-----
316			
317		v	err
318	3.1.2.1.1	<Validate version>	--> server-error-version-not-
319			supported
320		ok	
321		v	err
322	3.1.2.1.2	<Validate operation>	--> server-error-operation-not-
323			supported
324		ok	
325		v	err
326	3.1.2.1.4.1-	<Validate presence>	--> client-error-bad-request

352			too-long
353			client-error-attributes-or-
354			values-not-supported
355			

3.1.2.1.1 Validate version number

Every request and every response contains the "version-number" attribute. The value of this attribute is the major and minor version number of the syntax and semantics that the client and IPP object is using, respectively. The "version-number" attribute remains in a fixed position across all future versions so that all clients and IPP object that support future versions can determine which version is being used. The IPP object checks to see if the major version number supplied in the request is supported. If not, the Printer object REJECTS the request and RETURNS the 'server-error-version-not-supported' status code in the response. The IPP object returns in the "version-number" response attribute the major and minor version for the error response. Thus the client can learn at least one major and minor version that the IPP object supports. The IPP object is encouraged to return the closest version number to the one supplied by the client.

The checking of the minor version number is implementation dependent, however if the client-supplied minor version is explicitly supported, the IPP object MUST respond using that identical minor version number. If the major version number matches, but the minor version number does not, the Printer SHOULD accept and attempt to process the request, or MAY reject the request and return the 'server-error-version-not-supported' status code. In all cases, the Printer MUST return the nearest version number that it supports. For example, suppose that an IPP/1.2 Printer supports versions '1.1' and '1.2'. The following responses are conforming:

Table 6 - Examples of validating IPP version

Client supplies	Printer Accept Request?	Printer returns
1.0	yes (SHOULD)	1.1
1.0	no (SHOULD NOT)	1.1
1.1	yes (MUST)	1.1
1.2	yes (MUST)	1.2
1.3	yes (SHOULD)	1.2
1.3	no (SHOULD NOT)	1.2

375

It is advantageous for Printers to support both IPP/1.1 and IPP/1.0, so that they can interoperate with either client implementations. Some implementations may allow an Administrator to explicitly disable support for one or the other by setting the "ipp-versions-supported" Printer description attribute.

Likewise, it is advantageous for clients to support both versions to allow interoperability with new and legacy Printers.

3.1.2.1.2 Validate operation identifier

The Printer object checks to see if the "operation-id" attribute supplied by the client is supported as indicated in the Printer object's "operations-supported" attribute. If not, the Printer REJECTS the request and returns the 'server-error-operation-not-supported' status code in the response.

385 3.1.2.1.3 Validate the request identifier

386 The Printer object SHOULD NOT check to see if the "request-id" attribute supplied by the client is in
387 range: between 1 and $2^{31} - 1$ (inclusive), but copies all 32 bits.

388 Note: The "version-number", "operation-id", and the "request-id" parameters are in fixed octet
389 positions in the IPP/1.1 encoding. The "version-number" parameter will be the same fixed octet
390 position in all versions of the protocol. These fields are validated before proceeding with the rest of the
391 validation.

392 3.1.2.1.4 Validate attribute group and attribute presence and order

393 The order of the following validation steps depends on implementation.

394 3.1.2.1.4.1 Validate the presence and order of attribute groups

395 Client requests and IPP object responses contain attribute groups that Section 3 requires to be present
396 and in a specified order. An IPP object verifies that the attribute groups are present and in the correct
397 order in requests supplied by clients (attribute groups without an * in the following tables).

398 If an IPP object receives a request with (1) required attribute groups missing, or (2) the attributes
399 groups are out of order, or (3) the groups are repeated, the IPP object REJECTS the request and
400 RETURNS the 'client-error-bad-request' status code. For example, it is an error for the Job Template
401 Attributes group to occur before the Operation Attributes group, for the Operation Attributes group to
402 be omitted, or for an attribute group to occur more than once, except in the Get-Jobs response.

403 Since this kind of attribute group error is most likely to be an error detected by a client developer rather
404 than by a customer, the IPP object NEED NOT return an indication of which attribute group was in
405 error in either the Unsupported Attributes group or the Status Message. Also, the IPP object NEED
406 NOT find all attribute group errors before returning this error.

407 3.1.2.1.4.2 Ignore unknown attribute groups in the expected position

408 Future attribute groups may be added to the specification at the end of requests just before the
409 Document Content and at the end of response, except for the Get-Jobs response, where it maybe there
410 or before the first job attributes returned. If an IPP object receives an unknown attribute group in these
411 positions, it ignores the entire group, rather than returning an error, since that group may be a new
412 group in a later minor version of the protocol that can be ignored. (If the new attribute group cannot be
413 ignored without confusing the client, the major version number would have been increased in the
414 protocol document and in the request). If the unknown group occurs in a different position, the IPP
415 object REJECTS the request and RETURNS the 'client-error-bad-request' status code.

416 Clients also ignore unknown attribute groups returned in a response.

417 Note: By validating that requests are in the proper form, IPP objects force clients to use the proper
 418 form which, in turn, increases the chances that customers will be able to use such clients from multiple
 419 vendors with IPP objects from other vendors.

420 3.1.2.1.4.3 Validate the presence of a single occurrence of required Operation attributes

421 Client requests and IPP object responses contain Operation attributes that [RFC2911] Section 3
 422 requires to be present. Attributes within ~~a~~ the Operation attributes group (Group 1) in a request may be
 423 in any order, except for the ordering of target, charset, and natural languages attributes. These
 424 attributes MUST be first, and MUST be supplied in the following order: charset, natural language, and
 425 then target. An IPP object verifies that the attributes that Section 4 requires to be supplied by the client
 426 have been supplied in the request (attributes without an * in the following tables). An asterisk (*)
 427 indicates groups and Operation attributes that the client may omit in a request or an IPP object may
 428 omit in a response.

429 If an IPP object receives a request with required attributes missing ~~or~~ repeated ~~from a group~~ or in the
 430 wrong position in the Operation Attributes group (Group 1), the behavior of the IPP object is
 431 IMPLEMENTATION DEPENDENT. Some of the possible implementations are:

432 REJECTS the request and RETURNS the 'client-error-bad-request' status code

433 accepts the request and uses the first occurrence of the attribute no matter where it is

434 accepts the request and uses the last occurrence of the attribute no matter where it is

435 accept the request and assume some default value for the missing attribute

436 Therefore, client MUST send conforming requests, if they want to receive the same behavior from all
 437 IPP object implementations. For example, it is an error for the "attributes-charset" or "attributes-
 438 natural-language" attribute to be omitted in any operation request, ~~or for an Operation attribute to be
 439 supplied in a Job Template group or a Job Template attribute to be supplied in an Operation Attribute
 440 group in a create request. It is also an error~~ to supply the "attributes-charset" attribute twice.

441 Since these kinds of attribute errors are most likely to be detected by a client developer rather than by a
 442 customer, the IPP object NEED NOT return an indication of which attribute was in error in either the
 443 Unsupported Attributes group or the Status Message. Also, the IPP object NEED NOT find all
 444 attribute errors before returning this error.

445 The following tables list all the attributes for all the operations by attribute group in each request and
 446 each response. The order of the groups is the order that the client supplies the groups as specified in
 447 [RFC2911] Section 3. The order of the attributes within a group is arbitrary, except as noted for some
 448 of the special operation attributes (charset, natural language, and target). The tables below use the
 449 following notation:

450 R indicates a REQUIRED attribute or operation that an IPP object MUST support

451 O indicates an OPTIONAL attribute or operation that an IPP object NEED NOT support

- 452 * indicates that a client MAY omit the attribute in a request and that an IPP object MAY omit
453 the attribute in a response. The absence of an * means that a client MUST supply
454 the attribute in a request and an IPP object MUST supply the attribute in a
455 response.
- 456 + indicates that this is not a IPP/1.0 operation, but is only a part of IPP/1.1 and future versions
457 of IPP.

458

459 Operation Requests

460 The tables below show the attributes in their proper attribute groups for operation requests:

461 Note: All operation requests contain "version-number", "operation-
462 id", and "request-id" parameters.

463

464 Print-Job Request (R):

- 465 Group 1: Operation Attributes (R)
466 attributes-charset (R)
467 attributes-natural-language (R)
468 printer-uri (R)
469 requesting-user-name (R*)
470 job-name (R*)
471 ipp-attribute-fidelity (R*)

706 Group 3: Job Object Attributes(R*) (see Note 2)

707 <requested attributes> (R*)

708

709 Pause-Printer Response (O+):

710 Resume-Printer Response (O+):

711 Purge-Printer Response (O+):

712 Group 1: Operation Attributes (R)

713 attributes-charset (R)

714 attributes-natural-language (R)

715 status-message (O*)

716 detailed-status-message (O*)

717 Group 2: Unsupported Attributes (R*) (see Note 4)

718 <unsupported attributes> (R*)

719

720 Note 2 - the Job Object Attributes and Printer Object Attributes are returned only if the IPP object
721 returns one of the success status codes.

722 Note 3 - the Unsupported Attributes Group is present only if the client included some Operation and/or
723 Job Template attributes or values that the Printer doesn't support whether a success or an error return.

724 Note 4 - the Unsupported Attributes Group is present only if the client included some Operation
725 attributes that the Printer doesn't support whether a success or an error return.

726 Note 5: for the Get-Jobs operation the response contains a separate Job Object Attributes group 3 to N
727 containing requested-attributes for each job object in the response.

728 3.1.2.1.5 Validate the values of the REQUIRED Operation attributes

729 An IPP object validates the values supplied by the client of the REQUIRED Operation attribute that the
730 IPP object MUST support. The next section specifies the validation of the values of the OPTIONAL
731 Operation attributes that IPP objects MAY support.

732 The IPP object performs the following syntactic validation checks of each Operation attribute value:

733 a) that the length of each Operation attribute value is correct for the attribute syntax tag
734 supplied by the client according to [RFC2911] Section 4.1,

735 b) that the attribute syntax tag is correct for that Operation attribute according to
736 [RFC2911] Section 3,

737 c) that the value is in the range specified for that Operation attribute according to
738 [RFC2911] Section 3,

739 d) that multiple values are supplied by the client only for operation attributes that are multi-
740 valued, i.e., that are 1setOf X according to [RFC2911] Section 3.

741

742 If any of these checks fail, the IPP object REJECTS the request and RETURNS the 'client-error-bad-
743 request' or the 'client-error-request-value-too-long' status code. Since such an error is most likely to be
744 an error detected by a client developer, rather than by an end-user, the IPP object NEED NOT return an
745 indication of which attribute had the error in either the Unsupported Attributes Group or the Status
746 Message. The description for each of these syntactic checks is explicitly expressed in the first IF
747 statement in the following table.

748 In addition, the IPP object checks each Operation attribute value against some Printer object attribute or
749 some hard-coded value if there is no "xxx-supported" Printer object attribute defined. If its value is not
750 among those supported or is not in the range supported, then the IPP object REJECTS the request and
751 RETURNS the error status code indicated in the table by the second IF statement. If the value of the
752 Printer object's "xxx-supported" attribute is 'no-value' (because the system administrator hasn't
753 configured a value), the check always fails.

754

755 attributes-charset (charset)

756 IF NOT a single non-empty 'charset' value, REJECT/RETURN 'client-error-bad-request'.
757 IF the value length is greater than 63 octets, REJECT/RETURN 'client-error-request-value-too-
758 long'.
759 IF NOT in the Printer object's "charset-supported" attribute, REJECT/RETURN "client-error-
760 charset-not-supported".

761

762 attributes-natural-language(naturalLanguage)

763 IF NOT a single non-empty 'naturalLanguage' value, REJECT/RETURN 'client-error-bad-
764 request'.
765 IF the value length is greater than 63 octets, REJECT/RETURN 'client-error-request-value-too-
766 long'.
767 ACCEPT the request even if not a member of the set in the Printer object's "generated-natural-
768 language-supported" attribute. If the supplied value is not a member of the Printer
769 object's "generated-natural-language-supported" attribute, use the Printer object's
770 "natural-language-configured" value.

771

772 requesting-user-name

773 IF NOT a single 'name' value, REJECT/RETURN 'client-error-bad-request'.
774 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
775 too-long'.
776 IF the IPP object can obtain a better-authenticated name, use it instead.
777

778 job-name(name)

779 IF NOT a single 'name' value, REJECT/RETURN 'client-error-bad-request'.
780 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
781 too-long'.
782 IF NOT supplied by the client, the Printer object creates a name from the document-name or
783 document-uri.
784

785 document-name (name)

786 IF NOT a single 'name' value, REJECT/RETURN 'client-error-bad-request'.
787 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
788 too-long'.
789

790 ipp-attribute-fidelity (boolean)

791 IF NEITHER a single 'true' NOR a single 'false' 'boolean' value, REJECT/RETURN 'client-
792 error-bad-request'.
793 IF the value length is NOT equal to 1 octet, REJECT/RETURN 'client-error-request-value-too-
794 long'.
795 IF NOT supplied by the client, the IPP object assumes the value 'false'.
796

797 document-format (mimeMediaType)

798 IF NOT a single non-empty 'mimeMediaType' value, REJECT/RETURN 'client-error-bad-
799 request'.
800 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
801 too-long'.
802 IF NOT in the Printer object's "document-format-supported" attribute, REJECT/RETURN
803 'client-error-document-format-not-supported'.
804 IF NOT supplied by the client, the IPP object assumes the value of the Printer object's
805 "document-format-default" attribute.
806

807 document-uri (uri)

808 IF NOT a single non-empty 'uri' value, REJECT/RETURN 'client-error-bad-request'.
809 IF the value length is greater than 1023 octets, REJECT/RETURN 'client-error-request-value-
810 too-long'.
811 IF the URI syntax is not valid, REJECT/RETURN 'client-error-bad-request'.

812 If the client-supplied URI scheme is not supported, i.e. the value is not in the Printer object's
813 referenced-uri-scheme-supported" attribute, the Printer object MUST reject the request
814 and return the 'client-error-uri-scheme-not-supported' status code. The Printer object
815 MAY check to see if the document exists and is accessible. If the document is not found
816 or is not accessible, REJECT/RETURN 'client-error-not found'.
817 last-document (boolean)
818 IF NEITHER a single 'true' NOR a single 'false' 'boolean' value, REJECT/RETURN 'client-
819 error-bad-request'.
820 IF the value length is NOT equal to 1 octet, REJECT/RETURN 'client-error-request-value-too-
821 long'.
822
823 job-id (integer(1:MAX))
824 IF NOT an single 'integer' value equal to 4 octets AND in the range 1 to MAX,
825 REJECT/RETURN 'client-error-bad-request'.
826 IF NOT a job-id of an existing Job object, REJECT/RETURN 'client-error-not-found' or 'client-
827 error-gone' status code, if keep track of recently deleted jobs.
828
829 requested-attributes (1setOf keyword)
830 IF NOT one or more 'keyword' values, REJECT/RETURN 'client-error-bad-request'.
831 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
832 too-long'.
833 Ignore unsupported values, which are the keyword names of unsupported attributes. Don't
834 bother to copy such requested (unsupported) attributes to the Unsupported Attribute
835 response group since the response will not return them.
836
837 which-jobs (type2 keyword)
838 IF NOT a single 'keyword' value, REJECT/RETURN 'client-error-bad-request'.
839 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-
840 too-long'.
841 IF NEITHER 'completed' NOR 'not-completed', copy the attribute and the unsupported value to
842 the Unsupported Attributes response group and REJECT/RETURN 'client-error-
843 attributes-or-values-not-supported'.
844 Note: a Printer still supports the 'completed' value even if it keeps no
845 completed/canceled/aborted jobs: by returning no jobs when so queried.
846 IF NOT supplied by the client, the IPP object assumes the 'not-completed' value.
847
848 my-jobs (boolean)
849 IF NEITHER a single 'true' NOR a single 'false' 'boolean' value, REJECT/RETURN 'client-
850 error-bad-request'.
851 IF the value length is NOT equal to 1 octet, REJECT/RETURN 'client-error-request-value-too-
852 long'.
853 IF NOT supplied by the client, the IPP object assumes the 'false' value.

854

855 limit (integer(1:MAX))

856 IF NOT a single 'integer' value equal to 4 octets AND in the range 1 to MAX,

857 REJECT/RETURN 'client-error-bad-request'.

858 IF NOT supplied by the client, the IPP object returns all jobs, no matter how many.

859

860 -----

861

862 **3.1.2.1.6 Validate the values of the OPTIONAL Operation attributes**

863 OPTIONAL Operation attributes are those that an IPP object MAY or MAY NOT support. An IPP
 864 object validates the values of the OPTIONAL attributes supplied by the client. The IPP object performs
 865 the same syntactic validation checks for each OPTIONAL attribute value as in Section 3.1.2.1.5. As in
 866 Section 3.1.2.1.5, if any fail, the IPP object REJECTS the request and RETURNS the 'client-error-bad-
 867 request' or the 'client-error-request-value-too-long' status code.

868 In addition, the IPP object checks each Operation attribute value against some Printer attribute or some
 869 hard-coded value if there is no "xxx-supported" Printer attribute defined. If its value is not among those
 870 supported or is not in the range supported, then the IPP object REJECTS the request and RETURNS
 871 the error status code indicated in the table. If the value of the Printer object's "xxx-supported" attribute
 872 is 'no-value' (because the system administrator hasn't configured a value), the check always fails.

873 If the IPP object doesn't recognize/support an attribute, the IPP object treats the attribute as an
 874 unknown or unsupported attribute (see the last row in the table below).

875 -----

876 document-natural-language (naturalLanguage)

877 IF NOT a single non-empty 'naturalLanguage' value, REJECT/RETURN 'client-error-bad-request'.

878 IF the value length is greater than 63 octets, REJECT/RETURN 'client-error-request-value-too-
879 long'.880 IF NOT a value that the Printer object supports in document formats, (no corresponding "xxx-
881 supported" Printer attribute), REJECT/RETURN 'client-error-natural-language-not-
882 supported'.

883

884 compression (type3 keyword)

885 IF NOT a single 'keyword' value, REJECT/RETURN 'client-error-bad-request'.

886 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
887 long'.

888 IF NOT in the Printer object's "compression-supported" attribute, ~~copy the attribute and the~~
889 ~~unsupported value to the Unsupported Attributes response group and~~ REJECT/RETURN
890 'client-error-~~attributes-or-values~~compression-not-supported'.
891 Note to IPP/1.0 implementers: Support for the "compression" attribute was optional in IPP/1.0 and
892 was changed to REQUIRED in IPP/1.1. However, an IPP/1.0 object SHOULD at least
893 check for the "compression" attribute being present and reject the create request, if they don't
894 support "compression". Not checking is a bug, since the data will be unintelligible.
895

896 job-k-octets (integer(0:MAX))

897 IF NOT a single 'integer' value equal to 4 octets,
898 REJECT/RETURN 'client-error-bad-request'.
899 IF NOT in the range of the Printer object's "job-k-octets-supported" attribute, copy the attribute and
900 the unsupported value to the Unsupported Attributes response group and REJECT/RETURN
901 'client-error-attributes-or-values-not-supported'.
902

903 job-impressions (integer(0:MAX))

904 IF NOT a single 'integer' value equal to 4 octets,
905 REJECT/RETURN 'client-error-bad-request'.
906 IF NOT in the range of the Printer object's "job-impressions-supported" attribute, copy the attribute
907 and the unsupported value to the Unsupported Attributes response group and
908 REJECT/RETURN 'client-error-attributes-or-values-not-supported'.
909

910 job-media-sheets (integer(0:MAX))

911 IF NOT a single 'integer' value equal to 4 octets,
912 REJECT/RETURN 'client-error-bad-request'.
913 IF NOT in the range of the Printer object's "job-media-sheets-supported" attribute, copy the attribute
914 and the unsupported value to the Unsupported Attributes response group and
915 REJECT/RETURN 'client-error-attributes-or-values-not-supported'.
916

917 message (text(127))

918 IF NOT a single 'text' value, REJECT/RETURN 'client-error-bad-request'.
919 IF the value length is greater than 127 octets,
920 REJECT/RETURN 'client-error-request-value-too-long'.
921

922 unknown or unsupported attribute

923 IF the attribute syntax supplied by the client is supported but the length is not legal for that attribute
924 syntax, REJECT/RETURN 'client-error-request-value-too-long'.
925 ELSE copy the attribute and value to the Unsupported Attributes response group and change the
926 attribute value to the "out-of-band" 'unsupported' value, but otherwise ignore the attribute.
927

928 Note: Future Operation attributes may be added to the protocol specification that may occur anywhere
929 in the specified group. When the operation is otherwise successful, the IPP object returns the
930 'successful-ok-ignored-or-substituted-attributes' status code. Ignoring unsupported Operation attributes
931 in all operations is analogous to the handling of unsupported Job Template attributes in the create and
932 Validate-Job operations when the client supplies the "ipp-attribute-fidelity" Operation attribute with the
933 'false' value. This last rule is so that we can add OPTIONAL Operation attributes to future versions of
934 IPP so that older clients can inter-work with new IPP objects and newer clients can inter-work with
935 older IPP objects. (If the new attribute cannot be ignored without performing unexpectedly, the major
936 version number would have been increased in the protocol document and in the request). This rule for
937 Operation attributes is independent of the value of the "ipp-attribute-fidelity" attribute. For example, if
938 an IPP object doesn't support the OPTIONAL "job-k-octets" attribute', the IPP object treats "job-k-
939 octets" as an unknown attribute and only checks the length for the 'integer' attribute syntax supplied by
940 the client. If it is not four octets, the IPP object REJECTS the request and RETURNS the 'client-error-
941 bad-request' status code, else the IPP object copies the attribute to the Unsupported Attribute response
942 group, setting the value to the "out-of-band" 'unsupported' value, but otherwise ignores the attribute.

943

943 **3.1.2.2 Suggested Additional Processing Steps for Operations that Create/Validate Jobs and Add**
 944 **Documents**

945 This section in combination with the previous section recommends the processing steps for the Print-
 946 Job, Validate-Job, Print-URI, Create-Job, Send-Document, and Send-URI operations that IPP objects
 947 SHOULD use. These are the operations that create jobs, validate a Print-Job request, and add
 948 documents to a job.

			v																											

980 **3.1.2.2.1 Default "ipp-attribute-fidelity" if not supplied**

981 The Printer object checks to see if the client supplied an "ipp-attribute-fidelity" Operation attribute [in](#)
 982 [the Operation Attribute group \(group 1\) in the request](#). If the attribute is not supplied by the client, the
 983 IPP object assumes that the value is 'false'.

984 3.1.2.2 Check that the Printer object is accepting jobs

985 If the value of the Printer objects "printer-is-accepting-jobs" is 'false', the Printer object REJECTS the
986 request and RETURNS the 'server-error-not-accepting-jobs' status code.

987 3.1.2.3 Validate the values of the Job Template attributes

988 An IPP object validates the values of all Job Template attribute supplied by the client. The IPP object
989 performs the analogous syntactic validation checks of each Job Template attribute value that it performs
990 for Operation attributes (see Section 3.1.2.1.5.):

991 a) that the length of each value is correct for the attribute syntax tag supplied by the client
992 according to [RFC2911] Section 4.1.

993 b) that the attribute syntax tag is correct for that attribute according to [RFC2911] Sections
994 4.2 to 4.4.

995 c) that multiple values are supplied only for multi-valued attributes, i.e., that are 1setOf X
996 according to [RFC2911] Sections 4.2 to 4.4.

997 As in Section 3.1.2.1.5, if any of these syntactic checks fail, the IPP object REJECTS the request and
998 RETURNS the 'client-error-bad-request' or 'client-error-request-value-too-long' status code as
999 appropriate, independent of the value of the "ipp-attribute-fidelity". Since such an error is most likely to
000 be an error detected by a client developer, rather than by an end-user, the IPP object NEED NOT return
001 an indication of which attribute had the error in either the Unsupported Attributes Group or the Status
002 Message. The description for each of these syntactic checks is explicitly expressed in the first IF
003 statement in the following table.

004 Each Job Template attribute MUST occur no more than once. If an IPP Printer receives a create
005 request with multiple occurrences of a Job Template attribute, it MAY:

006 1. reject the operation and return the 'client-error-bad-request' error status code

007 2. accept the operation and use the first occurrence of the attribute

008 3. accept the operation and use the last occurrence of the attribute

009 depending on implementation. Therefore, clients MUST NOT supply multiple occurrences of the
010 same Job Template attribute in the Job Attributes group in the request.

011 3.1.2.3 Algorithm for job validation

012 The process of validating a Job-Template attribute "xxx" against a Printer attribute "xxx-supported"
013 can use the following validation algorithm (see section 3.2.1.2 in [RFC2911]).

014 To validate the value U of Job-Template attribute "xxx" against the value V of Printer "xxx-
015 supported", perform the following algorithm:

- 016 1. If U is multi-valued, validate each value X of U by performing the algorithm in [Table 7](#)~~Table 7~~
017 with each value X. Each validation is separate from the standpoint of returning unsupported
018 values. Example: If U is "finishings" that the client supplies with 'staple', 'bind' values, then X
019 takes on the successive values: 'staple', then 'bind'
- 020 2. If V is multi-valued, validate X against each Z of V by performing the algorithm in [Table 7](#)~~Table~~
021 [7](#) with each value Z. If a value Z validates, the validation for the attribute value X succeeds. If it
022 fails, the algorithm is applied to the next value Z of V. If there are no more values Z of V,
023 validation fails. Example" If V is "sides-supported" with values: 'one-sided', 'two-sided-long', and
024 'two-sided-short', then Z takes on the successive values: 'one-sided', 'two-sided-long', and 'two-
025 sided-short'. If the client supplies "sides" with 'two-sided-long', the first comparison fails ('one-
026 sided' is not equal to 'two-sided-long'), the second comparison succeeds ('two-sided-long' is equal
027 to 'two-sided-long'), and the third comparison ('two-sided-short' with 'two-sided-long') is not
028 even performed.
- 029 3. If both U and V are single-valued, let X be U and Z be V and use the validation rules in [Table](#)
030 [7](#)~~Table 7~~.

031 **Table 7 - Rules for validating single values X against Z**

Attribute syntax of X	attribute syntax of Z	validated if:
integer	rangeOfInteger	X is within the range of Z
uri	uriScheme	the uri scheme in X is equal to Z
any	boolean	the value of Z is TRUE
any	any	X and Z are of the same type and are equal.

032

033 If the value of the Printer object's "xxx-supported" attribute is 'no-value' (because the system
034 administrator hasn't configured a value), the check always fails. If the check fails, the IPP object copies
035 the attribute to the Unsupported Attributes response group with its unsupported value. If the attribute
036 contains more than one value, each value is checked and each unsupported value is separately copied,
037 while supported values are not copied. If an IPP object doesn't recognize/support a Job Template
038 attribute, i.e., there is no corresponding Printer object "xxx-supported" attribute, the IPP object treats
039 the attribute as an unknown or unsupported attribute (see the last row in the table below).

040 If some Job Template attributes are supported for some document formats and not for others or the
041 values are different for different document formats, the IPP object SHOULD take that into account in
042 this validation using the value of the "document-format" supplied by the client (or defaulted to the value
043 of the Printer's "document-format-default" attribute, if not supplied by the client). For example, if
044 "number-up" is supported for the 'text/plain' document format, but not for the 'application/postscript'
045 document format, the check SHOULD (though it NEED NOT) depend on the value of the "document-
046 format" operation attribute. See "document-format" in [RFC2911] section 3.2.1.1 and 3.2.5.1.

047 Note: whether the request is accepted or rejected is determined by the value of the "ipp-attribute-
048 fidelity" [Operation](#) attribute in a subsequent step, so that all Job Template attribute supplied are
049 examined and all unsupported attributes and/or values are copied to the Unsupported Attributes
050 response group.

051 -----

052 job-priority (integer(1:100))

053 IF NOT a single 'integer' value with a length equal to 4 octets, REJECT/RETURN 'client-error-bad-
054 request'.

055 IF NOT supplied by the client, use the value of the Printer object's "job-priority-default" attribute at
056 job submission time.

057 IF NOT in the range 1 to 100, inclusive, copy the attribute and the unsupported value to the
058 Unsupported Attributes response group.

059 Map the value to the nearest supported value in the range 1:100 as specified by the number of
060 discrete values indicated by the value of the Printer's "job-priority-supported" attribute. See
061 the formula in [RFC2911] Section 4.2.1.
062

063 job-hold-until (type3 keyword | name)

064 IF NOT a single 'keyword' or 'name' value, REJECT/RETURN 'client-error-bad-request'.

065 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
066 long'.

067 IF NOT supplied by the client, use the value of the Printer object's "job-hold-until" attribute at job
068 submission time.

069 IF NOT in the Printer object's "job-hold-until-supported" attribute, copy the attribute and the
070 unsupported value to the Unsupported Attributes response group.
071

072 job-sheets (type3 keyword | name)

073 IF NOT a single 'keyword' or 'name' value, REJECT/RETURN 'client-error-bad-request'.

074 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
075 long'.

076 IF NOT in the Printer object's "job-sheets-supported" attribute, copy the attribute and the
077 unsupported value to the Unsupported Attributes response group.
078

079 multiple-document-handling (type2 keyword)

080 IF NOT a single 'keyword' value, REJECT/RETURN 'client-error-bad-request'.

081 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
082 long'.

083 IF NOT in the Printer object's "multiple-document-handling-supported" attribute, copy the attribute
084 and the unsupported value to the Unsupported Attributes response group.
085

086 copies (integer(1:MAX))

087 IF NOT a single 'integer' value with a length equal to 4 octets,
088 REJECT/RETURN 'client-error-bad-request'.
089 IF NOT in range of the Printer object's "copies-supported" attribute
090 copy the attribute and the unsupported value to the Unsupported Attributes response group.
091

092 **finishings** (1setOf type2 enum)

093 IF NOT an 'enum' value(s) each with a length equal to 4 octets, REJECT/RETURN 'client-error-bad-
094 request'.
095 IF NOT in the Printer object's "finishings-supported" attribute, copy the attribute and the
096 unsupported value(s), but not any supported values, to the Unsupported Attributes response
097 group.
098

099 **page-ranges** (1setOf rangeOfInteger(1:MAX))

100 IF NOT a 'rangeOfInteger' value(s) each with a length equal to 8 octets, REJECT/RETURN 'client-
101 error-bad-request'.
102 IF first value is greater than second value in any range, the ranges are not in ascending order, or
103 ranges overlap, REJECT/RETURN 'client-error-bad-request'.
104 IF the value of the Printer object's "page-ranges-supported" attribute is 'false', copy the attribute to
105 the Unsupported Attributes response group and set the value to the "out-of-band"
106 'unsupported' value.
107

108 **sides** (type2 keyword)

109 IF NOT a single 'keyword' value, REJECT/RETURN 'client-error-bad-request'.
110 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
111 long'.
112 IF NOT in the Printer object's "sides-supported" attribute, copy the attribute and the unsupported
113 value to the Unsupported Attributes response group.
114

115 **number-up** (integer(1:MAX))

116 IF NOT a single 'integer' value with a length equal to 4 octets,
117 REJECT/RETURN 'client-error-bad-request'.
118 IF NOT a value or in the range of one of the values of the Printer object's "number-up-supported"
119 attribute, copy the attribute and value to the Unsupported Attribute response group.
120

121 **orientation-requested** (type2 enum)

122 IF NOT a single 'enum' value with a length equal to 4 octets,
123 REJECT/RETURN 'client-error-bad-request'.
124 IF NOT in the Printer object's "orientation-requested-supported" attribute, copy the attribute and the
125 unsupported value to the Unsupported Attributes response group.
126

127 **media** (type3 keyword | name)

128 IF NOT a single 'keyword' or 'name' value, REJECT/RETURN 'client-error-bad-request'.
 129 IF the value length is greater than 255 octets, REJECT/RETURN 'client-error-request-value-too-
 130 long'.
 131 IF NOT in the Printer object's "media-supported" attribute, copy the attribute and the unsupported
 132 value to the Unsupported Attributes response group.
 133

134 printer-resolution (resolution)

135 IF NOT a single 'resolution' value with a length equal to 9 octets,
 136 REJECT/RETURN 'client-error-bad-request'.
 137 IF NOT in the Printer object's "printer-resolution-supported" attribute, copy the attribute and the
 138 unsupported value to the Unsupported Attributes response group.
 139

140 print-quality (type2 enum)

141 IF NOT a single 'enum' value with a length equal to 4 octets,
 142 REJECT/RETURN 'client-error-bad-request'.
 143 IF NOT in the Printer object's "print-quality-supported" attribute, copy the attribute and the
 144 unsupported value to the Unsupported Attributes response group.
 145

146 unknown or unsupported attribute (i.e., there is no corresponding Printer object "xxx-supported"
 147 attribute)

148 IF the attribute syntax supplied by the client is supported but the length is not legal for that attribute
 149 syntax,
 150 REJECT/RETURN 'client-error-bad-request' if the length of the attribute syntax is fixed or 'client-
 151 error-request-value-too-long' if the length of the attribute syntax is variable.
 152 ELSE copy the attribute and value to the Unsupported Attributes response group and change the
 153 attribute value to the "out-of-band" 'unsupported' value. Any remaining Job Template
 154 Attributes are either unknown or unsupported Job Template attributes and are validated
 155 algorithmically according to their attribute syntax for proper length (see below).
 156

157 -----
 158 If the attribute syntax is supported AND the length check fails, the IPP object REJECTS the request
 159 and RETURNS the 'client-error-bad-request' if the length of the attribute syntax is fixed or the 'client-
 160 error-request-value-too-long' status code if the length of the attribute syntax is variable. Otherwise, the
 161 IPP object copies the unsupported Job Template attribute to the Unsupported Attributes response
 162 group and changes the attribute value to the "out-of-band" 'unsupported' value. The following table
 163 shows the length checks for all attribute syntaxes. In the following table: "<=" means less than or
 164 equal, "=" means equal to:

Name	Octet length check for read-write attributes	
-----	-----	-----
'textWithLanguage	<= 1023 AND	'naturalLanguage' <= 63
'textWithoutLanguage'	<= 1023	
'nameWithLanguage'	<= 255 AND	'naturalLanguage' <= 63
'nameWithoutLanguage'	<= 255	

```

170      'keyword'          <= 255
171      'enum'            = 4
172      'uri'             <= 1023
173      'uriScheme'       <= 63
174      'charset'         <= 63
175      'naturalLanguage' <= 63
176      'mimeType'        <= 255
177      'octetString'     <= 1023
178      'boolean'         = 1
179      'integer'         = 4
180      'rangeOfInteger'  = 8
181      'dateTime'       = 11
182      'resolution'     = 9
183      'lsetOf X'
184

```

185 Note: It's possible for a Printer to receive a zero length keyword in a request. Since this is a keyword,
 186 its value needs to be compared with the supported values. Assuming that the printer doesn't have any
 187 values in its corresponding "xxx-supported" attribute that are keywords of zero length, the comparison
 188 will fail. Then the request will be accepted or rejected depending on the value of "ipp-attributes-
 189 fidelity" being 'false' or 'true', respectively. No special handling is required for

190 3.1.2.3.1 Check for conflicting Job Template attributes values

191 Once all the Operation and Job Template attributes have been checked individually, the Printer object
 192 SHOULD check for any conflicting values among all the supported values supplied by the client. For
 193 example, a Printer object might be able to staple and to print on transparencies, however due to physical
 194 stapling constraints, the Printer object might not be able to staple transparencies. The IPP object copies
 195 the supported attributes and their conflicting attribute values to the Unsupported Attributes response
 196 group. The Printer object only copies over those attributes that the Printer object either ignores or
 197 substitutes in order to resolve the conflict, and it returns the original values which were supplied by the
 198 client. For example suppose the client supplies "finishings" equals 'staple' and "media" equals
 199 'transparency', but the Printer object does not support stapling transparencies. If the Printer chooses to
 200 ignore the stapling request in order to resolve the conflict, the Printer objects returns "finishings" equal
 201 to 'staple' in the Unsupported Attributes response group. If any attributes are multi-valued, only the
 202 conflicting values of the attributes are copied.

203 Note: The decisions made to resolve the conflict (if there is a choice) is implementation dependent.

204 3.1.2.3.2 Decide whether to REJECT the request

205 If there were any unsupported Job Template attributes or unsupported/conflicting Job Template
 206 attribute values and the client supplied the "ipp-attribute-fidelity" [Operation](#) attribute with the 'true'
 207 value [in the Operation Attributes group \(Group 1\) in the request](#), the Printer object REJECTS the
 208 request and return the status code:

- 209 1. 'client-error-conflicting-attributes' status code, if there were any conflicts between attributes
210 supplied by the client.
211 2. 'client-error-attributes-or-values-not-supported' status code, otherwise.
212

213 Note: Unsupported Operation attributes or values that are returned do not affect the status returned in
214 this step. If the unsupported Operation attribute was a serious error, the above already rejected the
215 request in a previous step. If control gets to this step with unsupported Operation attributes being
216 returned, they are not serious errors.

217 In general, the final results of Job processing are unknown at Job submission time. The client has to
218 rely on notifications or polling to find out what happens at Job processing time. However, there are
219 cases in which some Printers can determine at Job submission time that Job processing is going to fail.
220 As an optimization, we'd like to have the Printer reject the Job in these cases.

221 There are three types of "processing" errors that might be detectable at Job submission time:

222 1. 'client-error-document-format-not-supported' : For the Print-Job, Send-Document, Print-URI, and
223 Send-URI operations, if all these conditions are true:

- 224 – the Printer supports auto-sensing,
225 – the request "document-format" operation attribute is 'application/octet-stream',
226 – the Printer receives document data before responding,
227 – the Printer auto-senses the document format before responding,
228 – the sensed document format is not supported by the Printer

229 then the Printer should respond with 'client-error-document-format-not-supported' status.

230 2. 'client-error-compression-error': For the Print-Job, Send-Document, Print-URI, and Send-URI
231 operations, if all these conditions are true:

- 232 – the client supplies a supported value for the "compression" operation attribute in the request
233 – the Printer receives document data before responding,
234 – the Printer attempts to decompress the document data before responding,
235 – the document data cannot be decompressed using the algorithm specified by the "compression"
236 operation attribute

237 then the Printer should respond with 'client-error-compression-error' status.

238 3. 'client-error-document-access-error': For the Print-URI, and Send-URI operations, if the Printer
239 attempts and fails to pull the referenced document data before responding, it should respond with
240 'client-error-document-access-error' status.

241 Some Printers are not able to detect these errors until Job processing time. In that case, the errors are
242 recorded in the corresponding job-state and job-state reason attributes. (There is no standard way for a
243 client to determine whether a Printer can detect these errors at Job submission time.) For example, if
244 auto-sensing happens AFTER the job is accepted (as opposed to auto-sensing at submit time before
245 returning the response), the implementation aborts the job, puts the job in the 'aborted' state and sets the
246 'unsupported-document-format' value in the job's "job-state-reasons".

247 A client should always provide a valid "document-format" operation attribute whenever practical. In
248 the absence of other information, a client itself may sniff the document data to determine document
249 format.

250 Auto sensing at Job submission time may be more difficult for the Printer when combined with
251 compression. For auto-sensed Jobs, a client may be better off deferring compression to the transfer
252 protocol layer, e.g.; by using the HTTP Content-Encoding header.

253 3.1.2.3.3 For the Validate-Job operation, RETURN one of the success status codes

254 If the requested operation is the Validate-Job operation, the Printer object returns:

- 255 1. the "successful-ok" status code, if there are no unsupported or conflicting Job Template
256 attributes or values.
- 257 2. the "successful-ok-conflicting-attributes, if there are any conflicting Job Template attribute or
258 values.
- 259 3. the "successful-ok-ignored-or-substituted-attributes, if there are only unsupported Job Template
260 attributes or values.

261

262 Note: Unsupported Operation attributes or values that are returned do not affect the status returned in
263 this step. If the unsupported Operation attribute was a serious error, the above already rejected the
264 request in a previous step. If control gets to this step with unsupported Operation attributes being
265 returned, they are not serious errors.

266 3.1.2.3.4 Create the Job object with attributes to support

267 If [the "ipp-attribute-fidelity" Operation attribute](#) is set to 'false' (or it was not supplied by the client [in](#)
268 [the Operation Attributes group](#)), the Printer object:

- 269 1. creates a Job object, assigns a unique value to the job's "job-uri" and "job-id" attributes, and
270 initializes all of the job's other supported Job Description attributes.
 - 271 2. removes all unsupported attributes from the Job object.
 - 272 3. for each unsupported value, removes either the unsupported value or substitutes the
273 unsupported attribute value with some supported value. If an attribute has no values after
274 removing unsupported values from it, the attribute is removed from the Job object (so that the
275 normal default behavior at job processing time will take place for that attribute).
 - 276 4. for each conflicting value, removes either the conflicting value or substitutes the conflicting
277 attribute value with some other supported value. If an attribute has no values after removing
278 conflicting values from it, the attribute is removed from the Job object (so that the normal
279 default behavior at job processing time will take place for that attribute).
- 280

281 If there were no attributes or values flagged as unsupported, or the value of [the 'ipp-attribute-fidelity'](#)
282 [Operation attribute](#) was 'false', the Printer object is able to accept the create request and create a new
283 Job object. If the "ipp-attribute-fidelity" [Operation](#) attribute is set to 'true', the Job Template attributes
284 that populate the new Job object are necessarily all the Job Template attributes supplied in the create
285 request. If the "ipp-attribute-fidelity" [Operation](#) attribute is set to 'false', the Job Template attributes
286 that populate the new Job object are all the client supplied Job Template attributes that are supported or
287 that have value substitution. Thus, some of the requested Job Template attributes may not appear in the
288 Job object because the Printer object did not support those attributes. The attributes that populate the
289 Job object are persistently stored with the Job object for that Job. A Get-Job-Attributes operation on
290 that Job object will return only those attributes that are persistently stored with the Job object.

291 Note: All Job Template attributes that are persistently stored with the Job object are intended to be
292 "override values"; that is, they that take precedence over whatever other embedded instructions might
293 be in the document data itself. However, it is not possible for all Printer objects to realize the semantics
294 of "override". End users may query the Printer's "pdl-override-supported" attribute to determine if the
295 Printer either attempts or does not attempt to override document data instructions with IPP attributes.

296 There are some cases, where a Printer supports a Job Template attribute and has an associated default
297 value set for that attribute. In the case where a client does not supply the corresponding attribute, the
298 Printer does not use its default values to populate Job attributes when creating the new Job object; only
299 Job Template attributes actually in the create request are used to populate the Job object. The Printer's
300 default values are only used later at Job processing time if no other IPP attribute or instruction
301 embedded in the document data is present.

302 Note: If the default values associated with Job Template attributes that the client did not supply were to
303 be used to populate the Job object, then these values would become "override values" rather than
304 defaults. If the Printer supports the 'attempted' value of the "pdl-override-supported" attribute, then
305 these override values could replace values specified within the document data. This is not the intent of
306 the default value mechanism. A default value for an attribute is used only if the create request did not
307 specify that attribute (or it was ignored when allowed by "ipp-attribute-fidelity" being 'false') and no
308 value was provided within the content of the document data.

309 If the client does not supply a value for some Job Template attribute, and the Printer does not support
310 that attribute, as far as IPP is concerned, the result of processing that Job (with respect to the missing
311 attribute) is undefined.

312 3.1.2.3.5 Return one of the success status codes

313 Once the Job object has been created, the Printer object accepts the request and returns to the client:

- 314 1. the 'successful-ok' status code, if there are no unsupported or conflicting Job Template attributes
315 or values.
- 316 2. the 'successful-ok-conflicting-attributes' status code, if there are any conflicting Job Template
317 attribute or values.

- 318 3. the 'successful-ok-ignored-or-substituted-attributes' status code, if there are only unsupported
319 Job Template attributes or values.

320

321 Note: Unsupported Operation attributes or values that are returned do not affect the status returned in
322 this step. If the unsupported Operation attribute was a serious error, the above already rejected the
323 request in a previous step. If control gets to this step with unsupported Operation attributes being
324 returned, they are not serious errors.

325 The Printer object also returns Job status attributes that indicate the initial state of the Job ('pending',
326 'pending-held', 'processing', etc.), etc. See Print-Job Response, [RFC2911] section 3.2.1.2.

327 **3.1.2.3.6 Accept appended Document Content**

328 The Printer object accepts the appended Document Content data and either starts it printing, or spools it
329 for later processing.

330 **3.1.2.3.7 Scheduling and Starting to Process the Job**

331 The Printer object uses its own configuration and implementation specific algorithms for scheduling the
332 Job in the correct processing order. Once the Printer object begins processing the Job, the Printer
333 changes the Job's state to 'processing'. If the Printer object supports PDL override (the "pdl-override-
334 supported" attribute set to 'attempted'), the implementation does its best to see that IPP attributes take
335 precedence over embedded instructions in the document data.

336 **3.1.2.3.8 Completing the Job**

337 The Printer object continues to process the Job until it can move the Job into the 'completed' state. If an
338 Cancel-Job operation is received, the implementation eventually moves the Job into the 'canceled' state.
339 If the system encounters errors during processing that do not allow it to progress the Job into a
340 completed state, the implementation halts all processing, cleans up any resources, and moves the Job
341 into the 'aborted' state.

342 **3.1.2.3.9 Destroying the Job after completion**

343 Once the Job moves to the 'completed', 'aborted', or 'canceled' state, it is an implementation decision as
344 to when to destroy the Job object and release all associated resources. Once the Job has been
345 destroyed, the Printer would return either the "client-error-not-found" or "client-error-gone" status
346 codes for operations directed at that Job.

347 Note: the Printer object SHOULD NOT re-use a "job-uri" or "job-id" value for a sufficiently long time
348 after a job has been destroyed, so that stale references kept by clients are less likely to access the wrong
349 (newer) job.

350 3.1.2.3.10 Interaction with "ipp-attribute-fidelity"

351 Some Printer object implementations may support "ipp-attribute-fidelity" set to 'true' and "pdl-override-
352 supported" set to 'attempted' and yet still not be able to realize exactly what the client specifies in the
353 create request. This is due to legacy decisions and assumptions that have been made about the role of
354 job instructions embedded within the document data and external job instructions that accompany the
355 document data and how to handle conflicts between such instructions. The inability to be 100% precise
356 about how a given implementation will behave is also compounded by the fact that the two special
357 attributes, "ipp-attribute-fidelity" and "pdl-override-supported", apply to the whole job rather than
358 specific values for each attribute. For example, some implementations may be able to override almost all
359 Job Template attributes except for "number-up". Character Sets, natural languages, and
360 internationalization

361 This section discusses character set support, natural language support and internationalization.

362 3.1.2.3.11 Character set code conversion support

363 IPP clients and IPP objects are REQUIRED to support UTF-8. They MAY support additional charsets.
364 It is RECOMMENDED that an IPP object also support US-ASCII, since many clients support US-
365 ASCII, and indicate that UTF-8 and US-ASCII are supported by populating the Printer's "charset-
366 supported" with 'utf-8' and 'us-ascii' values. An IPP object is required to code covert with as little loss
367 as possible between the charsets that it supports, as indicated in the Printer's "charsets-supported"
368 attribute.

369 How should the server handle the situation where the "attributes-charset" of the response itself is "us-
370 ascii", but one or more attributes in that response is in the "utf-8" format?

371 Example: Consider a case where a client sends a Print-Job request with "utf-8" as the value of
372 "attributes-charset" and with the "job-name" attribute supplied. Later another client submits a Get-Job-
373 Attribute or Get-Jobs request. This second request contains the "attributes-charset" with value "us-
374 ascii" and "requested-attributes" attribute with exactly one value "job-name".

375 According to the RFC2911 document (section 3.1.4.2), the value of the "attributes-charset" for the
376 response of the second request must be "us-ascii" since that is the charset specified in the request. The
377 "job-name" value, however, is in "utf-8" format. Should the request be rejected even though both "utf-
378 8" and "us-ascii" charsets are supported by the server? or should the "job-name" value be converted to
379 "us-ascii" and return "successful-ok-conflicting-attributes" (0x0002) as the status code?

380 Answer: An IPP object that supports both utf-8 (REQUIRED) and us-ascii, the second paragraph of
381 section 3.1.4.2 applies so that the IPP object MUST accept the request, perform code set conversion
382 between these two charsets with "the highest fidelity possible" and return 'successful-ok', rather than a
383 warning 'successful-ok-conflicting-attributes', or an error. The printer will do the best it can to convert
384 between each of the character sets that it supports--even if that means providing a string of question
385 marks because none of the characters are representable in US ASCII. If it can't perform such
386 conversion, it MUST NOT advertise us-ascii as a value of its "attributes-charset-supported" and MUST
387 reject any request that requests 'us-ascii'.

388 One IPP object implementation strategy is to convert all request text and name values to a Unicode
389 internal representation. This is 16-bit and virtually universal. Then convert to the specified operation
390 attributes-charset on output.

391 Also it would be smarter for a client to ask for 'utf-8', rather than 'us-ascii' and throw away characters
392 that it doesn't understand, rather than depending on the code conversion of the IPP object.

393 **3.1.2.3.12 What charset to return when an unsupported charset is requested (Issue 1.19)?**

394 Section 3.1.4.1 Request Operation attributes was clarified in November 1998 as follows:

395 All clients and IPP objects MUST support the 'utf-8' charset [RFC2044] and MAY support additional
396 charsets provided that they are registered with IANA [IANA-CS]. If the Printer object does not
397 support the client supplied charset value, the Printer object MUST reject the request, set the "attributes-
398 charset" to 'utf-8' in the response, and return the 'client-error-charset-not-supported' status code and any
399 'text' or 'name' attributes using the 'utf-8' charset.

400 Since the client and IPP object MUST support UTF-8, returning any text or name attributes in UTF-8
401 when the client requests a charset that is not supported should allow the client to display the text or
402 name.

403 Since such an error is a client error, rather than a user error, the client should check the status code first
404 so that it can avoid displaying any other returned 'text' and 'name' attributes that are not in the charset
405 requested.

406 Furthermore, [RFC2911] section 14.1.4.14 client-error-charset-not-supported (0x040D) was clarified in
407 November 1998 as follows:

408 For any operation, if the IPP Printer does not support the charset supplied by the client in the
409 "attributes-charset" operation attribute, the Printer MUST reject the operation and return this status and
410 any 'text' or 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1).

411 **3.1.2.3.13 Natural Language Override (NLO)**

412 The 'text' and 'name' attributes each have two forms. One has an implicit natural language, and the other
413 has an explicit natural language. The 'textWithoutLanguage' and 'textWithLanguage' are the two 'text'
414 forms. The 'nameWithoutLanguage' and 'nameWithLanguage' are the two 'name' forms. If a receiver
415 (IPP object or IPP client) supports an attribute with attribute syntax 'text', it **MUST** support both forms
416 in a request and a response. A sender (IPP client or IPP object) **MAY** send either form for any such
417 attribute. When a sender sends a WithoutLanguage form, the implicit natural language is specified in
418 the "attributes-natural-language" operation attribute, which all senders **MUST** include in every request
419 and response.

420 When a sender sends a WithLanguage form, it **MAY** be different from the implicit natural language
421 supplied by the sender or it **MAY** be the same. The receiver **MUST** treat either form equivalently.

422 There is an implementation decision for senders, whether to always send the WithLanguage forms or
423 use the WithoutLanguage form when the attribute's natural language is the same as the request or
424 response. The former approach makes the sender implementation simpler. The latter approach is more
425 efficient on the wire and allows inter-working with non-conforming receivers that fail to support the
426 WithLanguage forms. As each approach have advantages, the choice is completely up to the
427 implementer of the sender.

428 Furthermore, when a client receives a 'text' or 'name' job attribute that it had previously supplied, that
429 client **MUST NOT** expect to see the attribute in the same form, i.e., in the same WithoutLanguage or
430 WithLanguage form as the client supplied when it created the job. The IPP object is free to transform
431 the attribute from the WithLanguage form to the WithoutLanguage form and vice versa, as long as the
432 natural language is preserved. However, in order to meet this latter requirement, it is usually simpler for
433 the IPP object implementation to store the natural language explicitly with the attribute value, i.e., to
434 store using an internal representation that resembles the WithLanguage form.

435 The IPP Printer **MUST** copy the natural language of a job, i.e., the value of the "attributes-natural-
436 language" operation attribute supplied by the client in the create operation, to the Job object as a Job
437 Description attribute, so that a client is able to query it. In returning a Get-Job-Attributes response, the
438 IPP object **MAY** return one of three natural language values in the response's "attributes-natural-
439 language" operation attribute: (1) that requested by the requester, (2) the natural language of the job, or
440 (3) the configured natural language of the IPP Printer, if the requested language is not supported by the
441 IPP Printer.

442 This "attributes-natural-language" Job Description attribute is useful for an IPP object implementation
443 that prints start sheets in the language of the user who submitted the job. This same Job Description
444 attribute is useful to a multi-lingual operator who has to communicate with different job submitters in
445 different natural languages. This same Job Description attribute is expected to be used in the future to
446 generate notification messages in the natural language of the job submitter.

447 Early drafts of [RFC2911] contained a job-level natural language override (NLO) for the Get-Jobs
448 response. A job-level (NLO) is an (unrequested) Job Attribute which then specified the implicit natural
449 language for any other WithoutLanguage job attributes returned in the response for that job.
450 Interoperability testing of early implementations showed that no one was implementing the job-level
451 NLO in Get-Job responses. So the job-level NLO was eliminated from the Get-Jobs response. This
452 simplification makes all requests and responses consistent in that the implicit natural language for any
453 WithoutLanguage 'text' or 'name' form is always supplied in the request's or response's "attributes-
454 natural-language" operation attribute.

455 3.1.3 Status codes returned by operation

456 This section corresponds to [RFC2911] section 3.1.6 "Operation Response Status Codes and Status
457 Messages". This section lists all status codes once in the first operation (Print-Job). Then it lists the
458 status codes that are different or specialized for subsequent operations under each operation.

459 3.1.3.1 Printer Operations

460 3.1.3.1.1 Print-Job

461 The Printer object MUST return one of the following "status-code" values for the indicated reason.
462 Whether all of the document data has been accepted or not before returning the success or error
463 response depends on implementation. See Section 13 in [RFC2911] for a more complete description of
464 each status code.

465 For the following success status codes, the Job object has been created and the "job-id", and "job-uri"
466 assigned and returned in the response:

467 successful-ok: no request attributes were substituted or ignored.

468 successful-ok-ignored-or-substituted-attributes: some supplied (1) attributes were ignored or (2)
469 unsupported attribute syntaxes or values were substituted with supported values or were ignored.
470 Unsupported attributes, attribute syntax's, or values MUST be returned in the Unsupported
471 Attributes group of the response.

472 successful-ok-conflicting-attributes: some supplied attribute values conflicted with the values of
473 other supplied attributes and were either substituted or ignored. Attributes or values which
474 conflict with other attributes and have been substituted or ignored MUST be returned in the
475 Unsupported Attributes group of the response as supplied by the client.
476

477 [RFC2911] section 3.1.6 Operation Status Codes and Messages states:

478 If the Printer object supports the "status-message" operation attribute, it SHOULD use the
479 REQUIRED 'utf-8' charset to return a status message for the following error status codes (see
480 section 13 in [RFC2911]): 'client-error-bad-request', 'client-error-charset-not-supported', 'server-
481 error-internal-error', 'server-error-operation-not-supported', and 'server-error-version-not-supported'.
482 In this case, it MUST set the value of the "attributes-charset" operation attribute to 'utf-8' in the error
483 response.

484 For the following error status codes, no job is created and no "job-id" or "job-uri" is returned:

485 client-error-bad-request: The request syntax does not conform to the specification.

486 client-error-forbidden: The request is being refused for authorization or authentication reasons.

487 The implementation security policy is to not reveal whether the failure is one of

488 authentication or authorization.

489 client-error-not-authenticated: Either the request requires authentication information to be

490 supplied or the authentication information is not sufficient for authorization.

491 client-error-not-authorized: The requester is not authorized to perform the request on the target

492 object.

493 client-error-not-possible: The request cannot be carried out because of the state of the system.

494 See also 'server-error-not-accepting-jobs' status code, which MUST take precedence if the

495 Printer object's "printer-accepting-jobs" attribute is 'false'.

496 client-error-timeout: not applicable.

497 client-error-not-found: the target object does not exist.

498 client-error-gone: the target object no longer exists and no forwarding address is known.

499 client-error-request-entity-too-large: the size of the request and/or print data exceeds the

500 capacity of the IPP Printer to process it.

501 client-error-request-value-too-long: the size of request variable length attribute values, such as

502 'text' and 'name' attribute syntax's, exceed the maximum length specified in [RFC2911] for the

503 attribute and MUST be returned in the Unsupported Attributes Group.

504 client-error-document-format-not-supported: the document format supplied is not supported.

505 The "document-format" attribute with the unsupported value MUST be returned in the

506 Unsupported Attributes Group. This error SHOULD take precedence over any other 'xxx-

507 not-supported' error, except 'client-error-charset-not-supported'.

508 client-error-attributes-or-values-not-supported: one or more supplied attributes, attribute

509 syntax's, or values are not supported and the client supplied the "ipp-attributes-fidelity"

510 operation attribute with a 'true' value. They MUST be returned in the Unsupported

511 Attributes Group as explained below.

512 client-error-uri-scheme-not-supported: not applicable.

513 client-error-charset-not-supported: the charset supplied in the "attributes-charset" operation

514 attribute is not supported. The Printer's "configured-charset" MUST be returned in the

515 response as the value of the "attributes-charset" operation attribute and used for any 'text' and

516 'name' attributes returned in the error response. This error SHOULD take precedence over

517 any other error, unless the request syntax is so bad that the client's supplied "attributes-

518 charset" cannot be determined.

519 client-error-conflicting-attributes: one or more supplied attribute values conflicted with each

520 other and the client supplied the "ipp-attributes-fidelity" operation attribute with a 'true'

521 value. They MUST be returned in the Unsupported Attributes Group as explained below.

522 server-error-internal-error: an unexpected condition prevents the request from being fulfilled.

523 server-error-operation-not-supported: not applicable (since Print-Job is REQUIRED).

524 server-error-service-unavailable: the service is temporarily overloaded.

525 server-error-version-not-supported: the version in the request is not supported. The "closest"

526 version number supported MUST be returned in the response.

527 server-error-device-error: a device error occurred while receiving or spooling the request or

528 document data or the IPP Printer object can only accept one job at a time.

529 server-error-temporary-error: a temporary error such as a buffer full write error, a memory
530 overflow, or a disk full condition occurred while receiving the request and/or the document
531 data.
532 server-error-not-accepting-jobs: the Printer object's "printer-is-not-accepting-jobs" attribute is
533 'false'.
534 server-error-busy: the Printer is too busy processing jobs to accept another job at this time.
535 server-error-job-canceled: the job has been canceled by an operator or the system while the
536 client was transmitting the document data.

537 3.1.3.1.2 Print-URI

538 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
539 Print-URI with the following specializations and differences. See Section 14 for a more complete
540 description of each status code.

541 client-error-uri-scheme-not-supported: the URI scheme supplied in the "document-uri" operation
542 attribute is not supported and is returned in the Unsupported Attributes group.
543 server-error-operation-not-supported: the Print-URI operation is not supported.
544

545 3.1.3.1.3 Validate-Job

546 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
547 Validate-Job. See Section 13 in [RFC2911] for a more complete description of each status code.

548 3.1.3.1.4 Create-Job

549 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
550 Create-Job with the following specializations and differences. See Section 13 in [RFC2911] for a more
551 complete description of each status code.

552 server-error-operation-not-supported: the Create-Job operation is not supported.
553 client-error-multiple-document-jobs-not-supported: while the Create-Job and Send-Document
554 operations are supported, this implementation doesn't support more than one document with
555 data.

556 3.1.3.1.5 Get-Printer-Attributes

557 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to the
558 Get-Printer-Attributes operation with the following specialization's and differences. See Section 13 in
559 [RFC2911] for a more complete description of each status code.

560 For the following success status codes, the requested attributes are returned in Group 3 in the response:
561 successful-ok: no operation attributes or values were substituted or ignored (same as Print-Job)and
562 no requested attributes were unsupported.

563 *Note to client implementers: If the client requests attributes that are not supported by the*
 564 *Printer, the Printer is supposed to return 'successful-ok-ignored-or-substituted-attributes',*
 565 *rather than 'successful-ok'. However, a number of implementations have been found not to*
 566 *conform to this requirement, so clients should be tolerant of such Printers.*
 567 successful-ok-ignored-or-substituted-attributes: ~~same as Print-Job, except for this status code~~ The
 568 "requested-attributes" operation attribute ~~MAYSHOULD~~, ~~but NEED NOT~~, be returned with
 569 the unsupported values in the Unsupported Attributes Group.
 570 *Note to client implementers: Although NOT RECOMMENDED, the Unsupported Attribute*
 571 *Group and its contents MAY be omitted. Clients SHOULD be prepared for this behavior.*
 572 successful-ok-conflicting-attributes: same as Print-Job.

573 For the error status codes, Group 3 is returned containing no attributes or is not returned at all:

574 client-error-not-possible: Same as Print-Job, in addition the Printer object is not accepting any
 575 requests.
 576 client-error-request-entity-too-large: same as Print-job, except that no print data is involved.
 577 client-error-attributes-or-values-not-supported: not applicable, since unsupported operation
 578 attributes and/or values MUST be ignored and an appropriate success code returned (see above).
 579 client-error-conflicting-attributes: same as Print-Job, except that "ipp-attribute-fidelity" is not
 580 involved.
 581 server-error-operation-not-supported: not applicable (since Get-Printer-Attributes is REQUIRED).
 582 server-error-device-error: same as Print-Job, except that no document data is involved.
 583 server-error-temporary-error: same as Print-Job, except that no document data is involved.
 584 server-error-not-accepting-jobs: not applicable.
 585 server-error-busy: same as Print-Job, except the IPP object is too busy to accept even query
 586 requests.
 587 server-error-job-canceled: not applicable.

588 3.1.3.1.6 Get-Jobs

589 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to the
 590 Get-Jobs operation with the following specialization's and differences. See Section 13 in [RFC2911]
 591 for a more complete description of each status code.

592 For the following success status codes, the requested attributes are returned in Group 3 in the response:

593 successful-ok: same as Get-Printer-Attributes (see section 3.1.3.1.5).
 594 successful-ok-ignored-or-substituted-attributes: same as Get-Printer-Attributes (see section
 595 3.1.3.1.5).
 596 successful-ok-conflicting-attributes: same as Get-Printer-Attributes (see section 3.1.3.1.5).

597 For any error status codes, Group 3 is returned containing no attributes or is not returned at all. The
 598 following brief error status code descriptions contain unique information for use with Get-Jobs
 599 operation. See section 14 for the other error status codes that apply uniformly to all operations:

600 client-error-not-possible: Same as Print-Job, in addition the Printer object is not accepting any
 601 requests.
 602 client-error-request-entity-too-large: same as Print-job, except that no print data is involved.

603 client-error-document-format-not-supported: not applicable.
604 client-error-attributes-or-values-not-supported: not applicable, since unsupported operation
605 attributes and/or values MUST be ignored and an appropriate success code returned (see
606 above).
607 client-error-conflicting-attributes: same as Print-Job, except that "ipp-attribute-fidelity" is not
608 involved.
609 server-error-operation-not-supported: not applicable (since Get-Jobs is REQUIRED).
610 server-error-device-error: same as Print-Job, except that no document data is involved.
611 server-error-temporary-error: same as Print-Job, except that no document data is involved.
612 server-error-not-accepting-jobs: not applicable.
613 server-error-job-canceled: not applicable.

614 3.1.3.1.7 Pause-Printer

615 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
616 Pause-Printer with the following specializations and differences. See Section 13 in [RFC2911] for a
617 more complete description of each status code.

618 For the following success status codes, the Printer object is being stopped from scheduling jobs on all its
619 devices.

620 successful-ok: no request attributes were substituted or ignored (same as Print-Job).
621 successful-ok-ignored-or-substituted-attributes: same as Print-Job.
622 successful-ok-conflicting-attributes: same as Print-Job.
623

624 For any of the error status codes, the Printer object has not been stopped from scheduling jobs on all its
625 devices.

626 client-error-not-possible: not applicable.
627 client-error-not-found: the target Printer object does not exist.
628 client-error-gone: the target Printer object no longer exists and no forwarding address is known.
629 client-error-request-entity-too-large: same as Print-Job, except no document data is involved.
630 client-error-document-format-not-supported: not applicable.
631 client-error-conflicting-attributes: same as Print-Job, except that the Printer's "printer-is-
632 accepting-jobs" attribute is not involved.
633 server-error-operation-not-supported: the Pause-Printer operation is not supported.
634 server-error-device-error: not applicable.
635 server-error-temporary-error: same as Print-Job, except no document data is involved.
636 server-error-not-accepting-jobs: not applicable.
637 server-error-job-canceled: not applicable.

638 3.1.3.1.8 Resume-Printer

639 All of the Print-Job status code descriptions in Section 3.1.3.1.1 Print-Job Response with the
640 specialization's described for Pause-Printer are applicable to Resume-Printer. See Section 13 in
641 [RFC2911] for a more complete description of each status code.

642 For the following success status codes, the Printer object resumes scheduling jobs on all its devices.

643 successful-ok: no request attributes were substituted or ignored (same as Print-Job).

644 successful-ok-ignored-or-substituted-attributes: same as Print-Job.

645 successful-ok-conflicting-attributes: same as Print-Job.

646 For any of the error status codes, the Printer object does not resume scheduling jobs.

647 server-error-operation-not-supported: the Resume-Printer operation is not supported.

648

649 **3.1.3.1.8.1 What about Printers unable to change state due to an error condition?**

650 If, in case, the IPP printer is unable to change its state due to some problem with the actual printer
651 device (say, it is shut down or there is a media-jam as indicated in [RFC2911]), what should be the
652 result of the "Resume-Printer" operation? Should it still change the 'printer-state-reasons' and return
653 success or should it fail ?

654 The Resume-Printer operation must clear the 'paused' or 'moving-to-paused' 'printer-state-message'.

655 The operation must return a 'successful-ok' status code.

656 **3.1.3.1.8.2 How is "printer-state" handled on Resume-Printer?**

657

658 If the Resume-Printer operation succeeds, what should be the value of "printer-state" and who should
659 take care of the "printer-state" attribute value later on ?

660 The Resume-Printer operation may change the "printer-state-reasons" value.

661 The "printer-state" will change to one of three states:

662 1. 'idle' - no additional jobs and no error conditions present

663 2. 'processing' - job available and no error conditions present

664 3. current state (i.e. no change) an error condition is present (e.g. media jam)

665 In the third case the "printer-state-reason" will be cleared by automata when it detects the error
666 condition no longer exists. The "printer-state" will move to 'idle' or 'processing' when conditions
667 permit. (i.e. no more error conditions)

668 **3.1.3.1.9 Purge-Printer**

669 All of the Print-Job status code descriptions in Section 3.1.3.1.1 Print-Job Response with the
670 specialization's described for Pause-Printer are applicable to Purge-Printer. See Section 13 in
671 [RFC2911] for a more complete description of each status code.

672 For the following success status codes, the Printer object purges all it's jobs.
673 successful-ok: no request attributes were substituted or ignored (same as Print-Job).
674 successful-ok-ignored-or-substituted-attributes: same as Print-Job.
675 successful-ok-conflicting-attributes: same as Print-Job.

676 For any of the error status codes, the Printer object does not purge any jobs.
677 server-error-operation-not-supported: the Purge-Printer operation is not supported.

678 3.1.3.2 Job Operations

679 3.1.3.2.1 Send-Document

680 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to the
681 Get-Printer-Attributes operation with the following specialization's and differences. See Section 13 in
682 [RFC2911] for a more complete description of each status code.

683 For the following success status codes, the document has been added to the specified Job object and the
684 job's "number-of-documents" attribute has been incremented:

685 successful-ok: no request attributes were substituted or ignored (same as Print-Job).
686 successful-ok-ignored-or-substituted-attributes: same as Print-Job.
687 successful-ok-conflicting-attributes: same as Print-Job.

688 For the error status codes, no document has been added to the Job object and the job's "number-of-
689 documents" attribute has not been incremented:

690 client-error-not-possible: Same as Print-Job, except that the Printer's "printer-is-accepting-jobs"
691 attribute is not involved, so that the client is able to finish submitting a job that was created
692 with a Create-Job operation after this attribute has been set to 'true'. Another condition is
693 that the state of the job precludes Send-Document, i.e., the job has already been closed out
694 by the client. However, if the IPP Printer closed out the job due to timeout, the 'client-error-
695 timeout' error status SHOULD be returned instead.
696 client-error-timeout: This request was sent after the Printer closed the job, because it has not
697 received a Send-Document or Send-URI operation within the Printer's "multiple-operation-
698 time-out" period .
699 client-error-request-entity-too-large: same as Print-Job.
700 client-error-conflicting-attributes: same as Print-Job, except that "ipp-attributes-fidelity"
701 operation attribute is not involved..
702 server-error-operation-not-supported: the Send-Document request is not supported.
703 server-error-not-accepting-jobs: not applicable.
704 server-error-job-canceled: the job has been canceled by an operator or the system while the
705 client was transmitting the data.

706 **3.1.3.2.2 Send-URI**

707 All of the Print-Job status code descriptions in Section 3.1.3.1.1 Print-Job Response with the
708 specialization's described for Send-Document are applicable to Send-URI. See Section 13 in
709 [RFC2911] for a more complete description of each status code.

710 client-error-uri-scheme-not-supported: the URI scheme supplied in the "document-uri"
711 operation attribute is not supported and the "document-uri" attribute MUST be returned in
712 the Unsupported Attributes group.
713 server-error-operation-not-supported: the Send-URI operation is not supported.
714

715 **3.1.3.2.3 Cancel-Job**

716 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
717 Cancel-Job with the following specializations and differences. See Section 13 in [RFC2911] for a more
718 complete description of each status code.

719 For the following success status codes, the Job object is being canceled or has been canceled:

720 successful-ok: no request attributes were substituted or ignored (same as Print-Job).
721 successful-ok-ignored-or-substituted-attributes: same as Print-Job.
722 successful-ok-conflicting-attributes: same as Print-Job.
723

724 For any of the error status codes, the Job object has not been canceled or was previously canceled.

725 client-error-not-possible: The request cannot be carried out because of the state of the Job
726 object ('completed', 'canceled', or 'aborted') or the state of the system.
727 client-error-not-found: the target Printer and/or Job object does not exist.
728 client-error-gone: the target Printer and/or Job object no longer exists and no forwarding
729 address is known.
730 client-error-request-entity-too-large: same as Print-Job, except no document data is involved.
731 client-error-document-format-not-supported: not applicable.
732 client-error-attributes-or-values-not-supported: not applicable, since unsupported operation
733 attributes and values MUST be ignored.
734 client-error-conflicting-attributes: same as Print-Job, except that the Printer's "printer-is-
735 accepting-jobs" attribute is not involved.
736 server-error-operation-not-supported: not applicable (Cancel-Job is REQUIRED).
737 server-error-device-error: same as Print-Job, except no document data is involved.
738 server-error-temporary-error: same as Print-Job, except no document data is involved.
739 server-error-not-accepting-jobs: not applicable..
740 server-error-job-canceled: not applicable.

741 **3.1.3.2.4 Get-Job-Attributes**

742 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
743 Get-Job-Attributes with the following specializations and differences. See Section 13 in [RFC2911] for
744 a more complete description of each status code.

745 For the following success status codes, the requested attributes are returned in Group 3 in the response:

746 successful-ok: same as Get-Printer-Attributes (see section 3.1.3.1.5).

747 successful-ok-ignored-or-substituted-attributes: same as Get-Printer-Attributes (see section
748 3.1.3.1.5).

749 successful-ok-conflicting-attributes: same as Get-Printer-Attributes (see section 3.1.3.1.5).

750 For the error status codes, Group 3 is returned containing no attributes or is not returned at all.

751 client-error-not-possible: Same as Print-Job, in addition the Printer object is not accepting any
752 requests.

753 client-error-document-format-not-supported: not applicable.

754 client-error-attributes-or-values-not-supported: not applicable.

755 client-error-uri-scheme-not-supported: not applicable.

756 client-error-attributes-or-values-not-supported: not applicable, since unsupported operation
757 attributes and/or values MUST be ignored and an appropriate success code returned (see
758 above).

759 client-error-conflicting-attributes: not applicable

760 server-error-operation-not-supported: not applicable (since Get-Job-Attributes is REQUIRED).

761 server-error-device-error: same as Print-Job, except no document data is involved.

762 server-error-temporary-error: same as Print-Job, except no document data is involved..

763 server-error-not-accepting-jobs: not applicable.

764 server-error-job-canceled: not applicable.

765 **3.1.3.2.5 Hold-Job**

766 All of the Print-Job status codes described in Section 3.1.3.1.1 Print-Job Response are applicable to
767 Hold-Job with the following specializations and differences. See Section 13 in [RFC2911] for a more
768 complete description of each status code.

769 For the following success status codes, the Job object is being held or has been held:

770 successful-ok: no request attributes were substituted or ignored (same as Print-Job).

771 successful-ok-ignored-or-substituted-attributes: same as Print-Job.

772 successful-ok-conflicting-attributes: same as Print-Job.

773

774 For any of the error status codes, the Job object has not been held or was previously held.

775 client-error-not-possible: The request cannot be carried out because of the state of the Job
776 object ('completed', 'canceled', or 'aborted') or the state of the system.

777 client-error-not-found: the target Printer and/or Job object does not exist.

778 client-error-gone: the target Printer and/or Job object no longer exists and no forwarding
779 address is known.
780 client-error-request-entity-too-large: same as Print-Job, except no document data is involved.
781 client-error-document-format-not-supported: not applicable.
782 client-error-conflicting-attributes: same as Print-Job, except that the Printer's "printer-is-
783 accepting-jobs" attribute is not involved.
784 server-error-operation-not-supported: the Hold-Job operation is not supported.
785 server-error-device-error: not applicable.
786 server-error-temporary-error: same as Print-Job, except no document data is involved.
787 server-error-not-accepting-jobs: not applicable.
788 server-error-job-canceled: not applicable.

789 3.1.3.2.6 Release-Job

790 All of the Print-Job status code descriptions in Section 3.1.3.1.1 Print-Job Response with the
791 specialization's described for Hold-Job are applicable to Release-Job. See Section 13 in [RFC2911] for
792 a more complete description of each status code.
793 server-error-operation-not-supported: the Release-Job operation is not supported.

794 3.1.3.2.7 Restart-Job

795 All of the Print-Job status code descriptions in Section 3.1.3.1.1 Print-Job Response with the
796 specialization's described for Hold-Job are applicable to Restart-Job. See Section 13 in [RFC2911] for
797 a more complete description of each status code.
798 server-error-operation-not-supported: the Restart-Job operation is not supported.
799

800 3.1.3.2.7.1 Can documents be added to a restarted job?

801 Assume I give a Create-Job request along with a set of 5 documents . All the documents get printed and
802 the job state is moved to completed . I issue a Restart-Job request on the job. Now the issue is that, if I
803 try to add new documents to the restarted job, will the IPP Server permit me to do so or return "client-
804 error-not-possible " and again print those 5 jobs?

805 A job can not move to the 'completed' state until all the documents have been processed. The 'last-
806 document' flag indicates when the last document for a job is being sent from the client. This is the
807 semantic equivalent of closing a job. No documents may be added once a job is closed. Section 3.3.7 of
808 the IPP/1.1 model states "The job is moved to the 'pending' job state and restarts the beginning on the
809 same IPP Printer object with the same attribute values." 'number-of-documents' is a job attribute.

810 3.1.4 Returning unsupported attributes in Get-Xxxx responses (Issue 1.18)

811 In the Get-Printer-Attributes, Get-Jobs, or Get-Job-Attributes responses, the client cannot depend on
812 getting unsupported attributes returned in the Unsupported Attributes group that the client requested,
813 but are not supported by the IPP object. However, such unsupported requested attributes will not be
814 returned in the Job Attributes or Printer Attributes group (since they are unsupported). Furthermore,
815 the IPP object is REQUIRED to return the 'successful-ok-ignored-or-substituted-attributes' status code,
816 so that the client knows that not all that was requested has been returned. However, see the note in
817 section 3.1.3.1.5 that some non-conforming Printers return 'successful-ok'.

818 3.1.5 Sending empty attribute groups

819 The [RFC2911] and [RFC2910] specifications RECOMMEND that a sender not send an empty
820 attribute group in a request or a response. However, they REQUIRE a receiver to accept an empty
821 attribute group as equivalent to the omission of that group. So a client SHOULD omit the Job
822 Template Attributes group entirely in a create operation that is not supplying any Job Template
823 attributes. Similarly, an IPP object SHOULD omit an empty Unsupported Attributes group if there are
824 no unsupported attributes to be returned in a response.

825 The [RFC2910] specification REQUIRES a receiver to be able to receive either an empty attribute
826 group or an omitted attribute group and treat them equivalently. The term "receiver" means an IPP
827 object for a request and a client for a response. The term "sender" means a client for a request and an
828 IPP object for a response.

829 There is an exception to the rule for Get-Jobs when there are no attributes to be returned. [RFC2910]
830 contains the following paragraph:

831 The syntax allows an xxx-attributes-tag to be present when the xxx-attribute-sequence that follows is
832 empty. The syntax is defined this way to allow for the response of Get-Jobs where no attributes are
833 returned for some job-objects. Although it is RECOMMENDED that the sender not send an xxx-
834 attributes-tag if there are no attributes (except in the Get-Jobs response just mentioned), the receiver
835 MUST be able to decode such syntax.

836 3.2 Printer Operations

837 3.2.1 Print-Job operation

838 3.2.1.1 Flow controlling the data portion of a Print-Job request (Issue 1.22)

839 A paused printer, or one that is stopped due to paper out or jam or spool space full or buffer space full,
840 may flow control the data of a Print-Job operation (at the TCP/IP layer), so that the client is not able to
841 send all the document data. Consequently, the Printer will not return a response until the condition is
842 changed.

843 The Printer should not return a Print-Job response with an error code in any of these conditions, since
844 either the printer will be resumed and/or the condition will be freed either by human intervention or as
845 jobs print.

846 In writing test scripts to test IPP Printers, the script must also be written not to expect a response, if the
847 printer has been paused, until the printer is resumed, in order to work with all possible implementations.

848 **3.2.1.2 Returning job-state in Print-Job response (Issue 1.30)**

849 An IPP client submits a small job via Print-Job. By the time the IPP printer/print server is putting
850 together a response to the operation, the job has finished printing and been removed as an object from
851 the print system. What should the job-state be in the response?

852 The Model suggests that the Printer return a response before it even accepts the document content.
853 The Job Object Attributes are returned only if the IPP object returns one of the success status codes.
854 Then the job-state would always be "pending" or "pending-held".

855 This issue comes up for the implementation of an IPP Printer object as a server that forwards jobs to
856 devices that do not provide job status back to the server. If the server is reasonably certain that the job
857 completed successfully, then it should return the job-state as 'completed'. Also the server can keep the
858 job in its "job history" long after the job is no longer in the device. Then a user could query the server
859 and see that the job was in the 'completed' state and completed as specified by the jobs "time-at-
860 completed" time, which would be the same as the server submitted the job to the device.

861 An alternative is for the server to respond to the client before or while sending the job to the device,
862 instead of waiting until the server has finished sending the job to the device. In this case, the server can
863 return the job's state as 'pending' with the 'job-outgoing' value in the job's "job-state-reasons" attribute.

864 If the server doesn't know for sure whether the job completed successfully (or at all), it could return the
865 (out-of-band) 'unknown' value.

866 On the other hand, if the server is able to query the device and/or setup some sort of event notification
867 that the device initiates when the job makes state transitions, then the server can return the current job
868 state in the Print-Job response and in subsequent queries because the server knows what the job state is
869 in the device (or can query the device).

870 All of these alternatives depend on implementation of the server and the device.

871 **3.2.2 Get-Printer-Attributes operation**

872 If a Printer supports the "printer-make-and-model" attribute and returns the .INF file model name of the
873 printer in that attribute, the Microsoft client will automatically install the correct driver (if available).

874 Clients which poll periodically for printer status or queued-job-count should use the "requested-
875 attributes" operation attribute to limit the scope of the query in order to save Printer and network
876 resources.

877 3.2.3 Get-Jobs operation

878 3.2.3.1 Get-Jobs, my-jobs='true', and 'requesting-user-name' (Issue 1.39)?

879 In [RFC2911] section 3.2.6.1 'Get-Jobs Request', if the attribute 'my-jobs' is present and set to TRUE,
880 MUST the 'requesting-user-name' attribute be there too, and if it's not present what should the IPP
881 printer do?

882 [RFC2911] Section 8.3 describes the various cases of "requesting-user-name" being present or not for
883 any operation. If the client does not supply a value for "requesting-user-name", the printer MUST
884 assume that the client is supplying some anonymous name, such as "anonymous".

885 3.2.3.2 Why is there a "limit" attribute in the Get-Jobs operation?

886 When using the Get-Jobs operation a client implementer might choose to limit the number of jobs that
887 the client shows on the first screenful. For example, if its UI can only display 50 jobs, it can defend itself
888 against a printer that would otherwise return 500 jobs, perhaps taking a long time on a slow dial-up line.
889 The client can then go and ask for a larger number of jobs in the background, while showing the user
890 the first 50 jobs. Since the job history is returned in reverse order, namely the most recently completed
891 jobs are returned first, the user is most likely interested in the first jobs that are returned. Limiting the
892 number of jobs may be especially useful for a client that is requesting 'completed' jobs from a printer that
893 keeps a long job history. Clients that don't mind sometimes getting very large responses, can omit the
894 "limit" attribute in their Get-Jobs requests.

895 3.2.4 Create-Job operation

896 A Printer may respond to a Create-Job operation with "job-state" 'pending' or 'pending-held' and " job-
897 state-reason" 'job-data-insufficient' to indicate that operation has been accepted by the Printer, but the
898 Printer is expecting additional document data before it can move the job into the 'processing' state.
899 Alternatively, it may respond with "job-state" 'processing' and "job-state-reason" 'job-incoming' to
900 indicate that the Create-Job operation has been accepted by the Printer, but the Printer is expecting
901 additional Send-Document and/or Send-URI operations and/or is accessing/accepting document data.
902 The second alternative is for non-spooling Printers that don't implement the 'pending' state.

903 Should the server wait for the "last-document" operation attribute set to 'true' before starting to
904 "process" the job?

905 It depends on implementation. Some servers spool the entire job, including all document data, before
906 starting to process, so such an implementation would wait for the "last-document" before starting to
907 process the job. If the time-out occurs without the "last-document", then the server takes one of the
908 indicated actions in section 3.3.1 in the [RFC2911] document. Other servers will start to process
909 document data as soon as they have some. These are the so-called "non-spooling" printers. Currently,
910 there isn't a way for a client to determine whether the Printer will spool all the data or will start to
911 process (and print) as soon as it has some data.

912 3.3 Job Operations

913 3.3.1 Validate-Job

914 The Validate-Job operation has been designed so that its implementation may be a part of the Print-Job
915 operation. Therefore, requiring Validate-Job is not a burden on implementers. Also it is useful for
916 client's to be able to count on its presence in all conformance implementations, so that the client can
917 determine before sending a long document, whether the job will be accepted by the IPP Printer or not.

918 3.3.2 Restart-Job

919 The Restart-Job operation allows the reprocessing of a completed job. Some jobs store the document
920 data on the printer. Jobs created using the Print-Job operation are an example. It is required that the
921 printer retains the job data after the job has moved to a 'completed state' in order for the Restart-Job
922 operation to succeed.

923 Some jobs contain only a reference to the job data. A job created using the Print-URI is an example of
924 such a job. When the Restart-Job operation is issued the job is reprocessed. The job data **MUST** be
925 retrieved again to print the job.

926 It is possible that a job fails while attempting to access the print data. When such a job is the target of a
927 Restart-Job the Printer **SHALL** attempt to retrieve the job data again.

928 4 Object Attributes

929 4.1 Attribute Syntax's

930 4.1.1 The 'none' value for empty sets (Issue 1.37)

931 [RFC2911] states that the 'none' value should be used as the value of a 1setOf when the set is empty. In
932 most cases, sets that are potentially empty contain keywords so the keyword 'none' is used, but for the 3
933 finishings attributes, the values are enums and thus the empty set is represented by the enum 3.
934 Currently there are no other attributes with 1setOf values, which can be empty and can contain values
935 that are not keywords. This exception requires special code and is a potential place for bugs. It would
936 have been better if we had chosen an out-of-band value, either "no-value" or some new value, such as
937 'none'. Since we didn't, implementations have to deal with the different representations of 'none',
938 depending on the attribute syntax.

939 **4.1.2 Multi-valued attributes (Issue 1.31)**

940 What is the attribute syntax for a multi-valued attribute? Since some attributes support values in more
941 than one data type, such as "media", "job-hold-until", and "job-sheets", IPP semantics associate the
942 attribute syntax with each value, not with the attribute as a whole. The protocol associates the attribute
943 syntax tag with each value. Don't be fooled, just because the attribute syntax tag comes before the
944 attribute keyword. All attribute values after the first have a zero length attribute keyword as the
945 indication of a subsequent value of the same attribute.

946 **4.1.3 Case Sensitivity in URIs (issue 1.6)**

947 IPP client and server implementations must be aware of the diverse uppercase/lowercase nature of
948 URIs. RFC 2396 defines URL schemes and Host names as case insensitive but reminds us that the rest
949 of the URL may well demonstrate case sensitivity. When creating URL's for fields where the choice is
950 completely arbitrary, it is probably best to select lower case. However, this cannot be guaranteed and
951 implementations **MUST NOT** rely on any fields being case-sensitive or case-insensitive in the URL
952 beyond the URL scheme and host name fields.

953 The reason that the IPP specification does not make any restrictions on URIs, is so that implementations
954 of IPP may use off-the-shelf components that conform to the standards that define URIs, such as RFC
955 2396 and the HTTP/1.1 specifications [RFC2616]. See these specifications for rules of matching,
956 comparison, and case-sensitivity.

957 It is also recommended that System Administrators and implementations avoid creating URLs for
958 different printers that differ only in their case. For example, don't have Printer1 and printer1 as two
959 different IPP Printers.

960 Example of equivalent URI's

961 `http://abc.com:80/~smith/home.html`

962 `http://ABC.com/%7Esmith/home.html`

963 `http://ABC.com:/%7esmith/home.html`

964 Example of equivalent URI's using the IPP scheme

965 `ipp://abc.com:631/~smith/home.html`

966 `ipp://ABC.com/%7Esmith/home.html`

967 `http://ABC.com:631/%7esmith/home.html`

968 The HTTP/1.1 specification [RFC2616] contains more details on comparing URLs.

969 4.1.4 Maximum length for xxxWithLanguage and xxxWithoutLanguage

970 The 'textWithLanguage' and 'nameWithLanguage' are compound syntaxes that have two components.
971 The first component is the 'language' component that can contain up to 63 octets. The second
972 component is the 'text' or 'name' component. The maximum length of these are 1023 octets and 255
973 octets respectively. The definition of attributes with either syntax may further restrict the length. (e.g.
974 printer-name (name(127)))

975 The length of the 'language' component has no effect on the allowable length of 'text' in
976 'textWithLanguage' or the length of 'name' in 'nameWithLanguage'

977 4.2 Job Template Attributes

978 4.2.1 multiple-document-handling(type2 keyword)

979 4.2.1.1 Support of multiple document jobs

980 IPP/1.0 is silent on which of the four effects an implementation would perform if it supports Create-Job,
981 but does not support "multiple-document-handling" or multiple documents per job. IPP/1.1 was
982 changed so that a Printer could support Create-Job without having to support multiple document jobs.
983 The "multiple-document-jobs-supported" (boolean) Printer description attribute was added to IPP/1.1
984 along with the 'server-error-multiple-document-jobs-not-supported' status code for a Printer to indicate
985 whether or not it supports multiple document jobs, when it supports the Create-Job operation. Also
986 IPP/1.1 was clarified that the Printer MUST support the "multiple-document-handling" (type2 keyword)
987 Job Template attribute with at least one value if the Printer supports multiple documents per job.

988 4.3 Job Description Attributes

989 4.3.1 Getting the date and time of day

990 The "date-time-at-creation", "date-time-at-processing", and "date-time-at-completed" attributes are
991 returned as dateTime syntax. These attributes are OPTIONAL for a Printer to support. However,
992 there are various ways for a Printer to get the date and time of day. Some suggestions:

- 993 1. A Printer can get time from an NTP timeserver if there's one reachable on the network . See
994 RFC 1305. Also DHCP option 32 in RFC 2132 returns the IP address of the NTP server.
- 995 2. Get the date and time at startup from a human operator
- 996 3. Have an operator set the date and time using a web administrative interface
- 997 4. Get the date and time from incoming HTTP requests, though the problems of spoofing need
998 to be considered. Perhaps comparing several HTTP requests could reduce the chances of spoofing.
- 999 5. Internal date time clock battery driven.

000 6. Query "<http://tycho.usno.navy.mil/cgi-bin/timer.pl>"

001 4.4 Printer Description Attributes

002 4.4.1 printer-state-reasons (1setOf type2 keyword)

003 4.4.1.1 Is a suffix needed for the "printer-state-reasons" 'none' value (Issue 3.6)?

004 The values of the "printer-state-reasons" MAY have suffixes of '-report', '-warning', and '-error'. If none
005 of these suffixes is included, the meaning is the same as 'error', i.e., the Printer is stopped. However, for
006 the 'none' value it is RECOMMENDED that no suffix be included, even though the Printer is not
007 stopped. -However, some implementations do include the '-report' suffix, i.e., return 'none-report'.
008 There is no semantic difference between the "printer-state-reasons" of 'none', 'none-report', and 'none-
009 error'. They all mean that no additional information on the printer's state is available.

010 4.4.2 queued-job-count (integer(0:MAX))

011 4.4.2.1 Why is "queued-job-count" RECOMMENDED (Issue 1.14)?

012 The reason that "queued-job-count" is RECOMMENDED, is that some clients look at that attribute
013 alone when summarizing the status of a list of printers, instead of doing a Get-Jobs to determine the
014 number of jobs in the queue. Implementations that fail to support the "queued-job-count" will cause
015 that client to display 0 jobs when there are actually queued jobs.

016 We would have made it a REQUIRED Printer attribute, but some implementations had already been
017 completed before the issue was raised, so making it a SHOULD was a compromise.

018 4.4.2.2 Is "queued-job-count" a good measure of how busy a printer is (Issue 1.15)?

019 The "queued-job-count" is not a good measure of how busy the printer is when there are held jobs. A
020 future registration could be to add a "held-job-count" (or an "active-job-count") Printer Description
021 attribute if experience shows that such an attribute (combination) is needed to quickly indicate how busy
022 a printer really is.

023 4.4.3 printer-current-time (dateTime)

024 A Printer implementation MAY support this attribute by obtaining the date and time by any number of
025 implementation-dependent means at startup or subsequently. Examples include:

- 026 1. an internal date time clock,
- 027 2. from the operator at startup using the console,
- 028 3. from an operator using an administrative web page,

- 029 4. from HTTP headers supplied in client requests,
030 5. use HTTP to query "<http://tycho.usno.navy.mil/cgi-bin/timer.pl>"
031 6. from the network, using NTP [RFC1305] or DHCP option 32 [RFC2132] that returns the IP
032 address of the NTP server.

033 If an implementation supports this attribute by obtaining the current time from the network (at startup
034 or later), but the time is not available, then the implementation **MUST** return the value of this attribute
035 using the out-of-band 'no-value' meaning not configured. See the beginning of section 4.1.

036 Since the new "date-and-time-at-xxx" Job Description attributes refer to the "printer-current-time", they
037 will be covered also.

038 **4.4.4 Printer-uri**

039 Must the operational attribute for printer-uri match one of the values in "printer-uri-supported"?

040 A forgiving printer implementation would not reject the operation. But the implementation has its rights
041 to reject a printer or job operation if the operational attribute printer-uri is not a value of the printer-uri-
042 supported. The printer may not be improperly configured. The request obviously reached the printer.
043 The printer could treat the printer-uri as the logical equivalent of a value in the printer-uri-supported. It
044 would be implementation dependent for which value, and associated security policy, would apply. This
045 does also apply to a job object specified with a printer-uri and job-id, or with a job-uri. See section 4.1.3
046 for how to compare URI's.

047 **4.5 Empty Jobs**

048 The IPP object model does not prohibit a job that contains no documents. Such a job may be created in
049 a number of ways including a 'create-job' followed by an 'add-document' that contains no data and has
050 the 'last-document' flag set.

051 An empty job is processed just as any other job. The operation that "closes" an empty job is not
052 rejected because the job is empty. If no other conditions exist, other than the job is empty, the response
053 to the operation will indicate success. After the job is scheduled and processed, the job state **SHALL** be
054 'completed'.

055 There will be some variation in the value(s) of the "job-state-reasons" attribute. It is required that if no
056 conditions, other than the job being empty, exist the "job-state-reasons" **SHALL** include the 'completed-
057 successfully'. If other conditions existed, the 'completed-with-warnings' or 'completed-with-errors'
058 values may be used.

059 **5 Directory Considerations**

060 **5.1 General Directory Schema Considerations**

061 The [RFC2911] document lists RECOMMENDED and OPTIONAL Printer object attributes for
062 directory schemas. See [RFC2911] APPENDIX E: Generic Directory Schema.

063 The SLP printer template is defined in the "Definition of the Printer Abstract Service Type v2.0"
064 document [svrloc-printer] [as used with SLPv2 \[RFC2608, RFC2609, RFC2926\]](#). The LDAP printer
065 [template schema](#) is defined in the "Internet Printing Protocol (IPP): LDAP Schema for Printer Services"
066 document [ldap-printer] [as used with LDAPv3 \[RFC2251, RFC2252\]](#). Both documents systematically
067 add "printer-" to any attribute that doesn't already start with "printer-" in order to keep the printer
068 directory attributes distinct from other directory attributes. Also, instead of using "printer-uri-
069 supported", "uri-authentication-supported", and "uri-security-supported", they use a "printer-xri-
070 supported" attribute with special syntax to contain all of the same information in a single attribute. [The](#)
071 ["printer-xri-supported" \(1setOf collection\) Printer Description attribute is also defined as an IPP](#)
072 [extension for use with the Set-Printer-Attributes operation \[ipp-set-ops\]](#).

073 **5.2 IPP Printer with a DNS name**

074 If the IPP printer has a DNS name should there be at least two values for the printer-uri-supported
075 attribute. One URL with the fully qualified DNS name the other with the IP address in the URL?

076 The printer may contain one or the other or both. It's up to the administrator to configure this attribute.

077 **6 Security Considerations**

078 [The security considerations given in \[RFC2911\] Section 8 "Security Considerations" all apply to this](#)
079 [document. In addition, the following sub-sections describes security consideration that have arisen as a](#)
080 [result of implementation testing. This section corresponds to the RFC2911 Section 8 "Security](#)
081 [Considerations.](#)

082 **6.1 Querying jobs with IPP that were submitted using other job submission protocols (Issue 1.32)**

083 The following clarification was added to [RFC2911] section 8.5:

084 8.5 Queries on jobs submitted using non-IPP protocols

085 If the device that an IPP Printer is representing is able to accept jobs using other job submission
086 protocols in addition to IPP, it is RECOMMEND that such an implementation at least allow such
087 "foreign" jobs to be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an
088 implementation NEED NOT support all of the same IPP job attributes as for IPP jobs. The IPP
089 object returns the 'unknown' out-of-band value for any requested attribute of a foreign job that is
090 supported for IPP jobs, but not for foreign jobs.

091 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such
092 "foreign jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-
093 Attributes and Cancel-Job. Such an implementation also needs to deal with the problem of
094 authentication of such foreign jobs. One approach would be to treat all such foreign jobs as
095 belonging to users other than the user of the IPP client. Another approach would be for the foreign
096 job to belong to 'anonymous'. Only if the IPP client has been authenticated as an operator or
097 administrator of the IPP Printer object, could the foreign jobs be queried by an IPP request.
098 Alternatively, if the security policy were to allow users to query other users' jobs, then the foreign
099 jobs would also be visible to an end-user IPP client using Get-Jobs and Get-Job-Attributes.

100 Thus IPP MAY be implemented as a "universal" protocol that provides access to jobs submitted with
101 any job submission protocol. As IPP becomes widely implemented, providing a more universal
102 access makes sense.

103 7 Encoding and Transport

104 This section discusses various aspects of IPP/1.1 Encoding and Transport [RFC2910].

105 A server is not required to send a response until after it has received the client's entire request. Hence, a
106 client ~~must need~~ not expect a response until after it has sent the entire request. An exception to this
107 statement is the case of the client specifying the "Expect: 100-continue" header. See section 7.7.

108 ~~–However, we~~We recommend that the server return a response as soon as possible if an error is
109 detected while the client is still sending the data, rather than waiting until all of the data is received.
110 Therefore, we also recommend that a client listen for an error response that an IPP server MAY send
111 before it receives all the data. In this case a client, if chunking the data, can send a premature zero-
112 length chunk to end the request before sending all the data (and so the client can keep the connection
113 open for other requests, rather than closing it). If the request is blocked for some reason, a client MAY
114 determine the reason by opening another connection to query the server using Get-Printer-Attributes.

115 IPP, by design, uses TCP's built-in flow control mechanisms [RFC 793] to throttle clients when Printers
116 are busy. Therefore, it is perfectly normal for an IPP client transmitting a Job to be blocked for a really
117 long time. Accordingly, socket timeouts must be avoided. Some socket implementations have a
118 timeout option, which specifies how long a write operation on a socket can be blocked before it times
119 out and the blocking ends. A client should set this option for infinite timeout when transmitting Job
120 submissions.

121 Some IPP client applications might be able to perform other useful work while a Job transmission is
122 blocked. For example, the client may have other jobs that it could transmit to other Printers
123 simultaneously. A client may have a GUI, which must remain responsive to the user while the Job
124 transmission is blocked. These clients should be designed to spawn a thread to handle the Job
125 transmission at its own pace, leaving the main application free to do other work. Alternatively, single-
126 threaded applications could use non-blocking I/O.

127 Some Printer conditions, such as jam or lack of paper, could cause a client to be blocked indefinitely.
128 Clients may open additional connections to the Printer to Get-Printer-Attributes, determine the state of
129 the device, alert a user if the printer is stopped, and let a user decide whether to abort the job
130 transmission or not.

131 In the following sections, there are tables of all HTTP headers, which describe their use in an IPP client
132 or server. The following is an explanation of each column in these tables.

- 133 - the "header" column contains the name of a header
- 134 - the "request/client" column indicates whether a client sends the header.
- 135 - the "request/ server" column indicates whether a server supports the header when received.
- 136 - the "response/ server" column indicates whether a server sends the header.
- 137 - the "response /client" column indicates whether a client supports the header when received.
- 138 - the "values and conditions" column specifies the allowed header values and the conditions for
139 the header to be present in a request/response.

140

141 The table for "request headers" does not have columns for responses, and the table for "response
142 headers" does not have columns for requests.

143 The following is an explanation of the values in the "request/client" and "response/ server" columns.

- 144 - **must:** the client or server **MUST** send the header,
- 145 - **must-if:** the client or server **MUST** send the header when the condition described in the "values
146 and conditions" column is met,
- 147 - **may:** the client or server **MAY** send the header
- 148 - **not:** the client or server **SHOULD NOT** send the header. It is not relevant to an IPP
149 implementation.

150

151 The following is an explanation of the values in the "response/client" and "request/ server" columns.

- 152 - **must:** the client or server **MUST** support the header,
- 153 - **may:** the client or server **MAY** support the header
- 154 - **not:** the client or server **SHOULD NOT** support the header. It is not relevant to an IPP
155 implementation.

156 7.1 General Headers

157 The following is a table for the general headers.

General-Header	Request		Response		Values and Conditions
	Client	Server	Server	Client	
Cache-Control	must	not	must	not	"no-cache" only
Connection	must-if	must	must-if	must	"close" only. Both client and server SHOULD keep a connection for the duration of a sequence of operations. The client and server MUST include this header for the last operation in such a sequence.
Date	may	may	must	may	per RFC 1123 [RFC1123] from RFC 2616 [RFC2616]
Pragma	must	not	must	not	"no-cache" only
Transfer-Encoding	must-if	must	must-if	must	"chunked" only . Header MUST be present if Content-Length is absent.
Upgrade	not	not	not	not	
Via	not	not	not	not	

158 **7.2 Request Headers**

159 The following is a table for the request headers.

Request-Header	Client	Server	Request Values and Conditions
----------------	--------	--------	-------------------------------

Request-Header	Client	Server	Request Values and Conditions
Accept	may	must	"application/ipp" only. This value is the default if the client omits it
Accept-Charset	not	not	Charset information is within the application/ipp entity
Accept-Encoding	may	must	empty and per RFC 2616 [RFC2616] and IANA registry for content-codings
Accept-Language	not	not	language information is within the application/ipp entity
Authorization	must-if	must	per RFC 2616. A client MUST send this header when it receives a 401 "Unauthorized" response and does not receive a "Proxy-Authenticate" header.
From	not	not	per RFC 2616. Because RFC recommends sending this header only with the user's approval, it is not very useful
Host	must	must	per RFC 2616
If-Match	not	not	
If-Modified-Since	not	not	
If-None-Match	not	not	
If-Range	not	not	
If-Unmodified-Since	not	not	
Max-Forwards	not	not	
Proxy-Authorization	must-if	not	per RFC 2616. A client MUST send this header when it receives a 401 "Unauthorized" response and a "Proxy-Authenticate" header.
Range	not	not	
Referrer	not	not	
User-Agent	not	not	

160 7.3 Response Headers

161 The following is a table for the request headers.

Response-Header	Server	Client	Response Values and Conditions
Accept-Ranges	not	not	
Age	not	not	
Location	must-if	may	per RFC 2616. When URI needs redirection.
Proxy-Authenticate	not	must	per RFC 2616
Public	may	may	per RFC 2616
Retry-After	may	may	per RFC 2616
Server	not	not	
Vary	not	not	
Warning	may	may	per RFC 2616
WWW-Authenticate	must-if	must	per RFC 2616. When a server needs to authenticate a client.

162 7.4 Entity Headers

163 The following is a table for the entity headers.

Entity-Header	Request		Response		Values and Conditions
	Client	Server	Server	Client	
Allow	not	not	not	not	
Content-Base	not	not	not	not	
Content-Encoding	may	must	must	must	per RFC 2616 and IANA registry for content codings.
Content-Language	not	not	not	not	Application/ipp handles language
Content-Length	must-if	must	must-if	must	the length of the message-body per RFC 2616. Header MUST be present if Transfer-Encoding is absent..
Content-Location	not	not	not	not	
Content-MD5	may	may	may	may	per RFC 2616
Content-Range	not	not	not	not	
Content-Type	must	must	must	must	"application/ipp" only
ETag	not	not	not	not	
Expires	not	not	not	not	
Last-Modified	not	not	not	not	

164 7.5 Optional support for HTTP/1.0

165 IPP implementations consist of an HTTP layer and an IPP layer. In the following discussion, the term
 166 "client" refers to the HTTP client layer and the term "server" refers to the HTTP server layer. The
 167 Encoding and Transport document [RFC2910] requires that HTTP 1.1 MUST be supported by all
 168 clients and all servers. However, a client and/or a server implementation may choose to also support
 169 HTTP 1.0.

170 This option means that a server may choose to communicate with a (non-conforming) client that only
 171 supports HTTP 1.0. In such cases the server should not use any HTTP 1.1 specific parameters or
 172 features and should respond using HTTP version number 1.0.

173 This option also means that a client may choose to communicate with a (non-conforming) server that
 174 only supports HTTP 1.0. In such cases, if the server responds with an HTTP 'unsupported version
 175 number' to an HTTP 1.1 request, the client should retry using HTTP version number 1.0.

176 7.6 HTTP/1.1 Chunking

177 7.6.1 Disabling IPP Server Response Chunking

178 Clients MUST anticipate that the HTTP/1.1 server may chunk responses and MUST accept them in
 179 responses. However, a (non-conforming) HTTP client that is unable to accept chunked responses may
 180 attempt to request an HTTP 1.1 server not to use chunking in its response to an operation by using the
 181 following HTTP header:

182 TE: identity

183 This mechanism should not be used by a server to disable a client from chunking a request, since
184 chunking of document data is an important feature for clients to send long documents.

185 7.6.2 Warning About the Support of Chunked Requests

186 This section describes some problems with the use of chunked requests and HTTP/1.1 servers. For
187 additional known problems with implementations of HTTP proxies and caching, see “Known HTTP
188 Proxy/Caching Problems” [RFC3143].

189 The HTTP/1.1 standard [RFC2616] requires that conforming servers support chunked requests for any
190 method. However, in spite of this requirement, some HTTP/1.1 implementations support chunked
191 responses in the GET method, but do not support chunked POST method requests. Some HTTP/1.1
192 implementations that support CGI scripts [CGI] and/or servlets [Servlet] require that the client supply a
193 Content-Length. These implementations might reject a chunked POST method and return a 411 status
194 code (Length Required), might attempt to buffer the request and run out of room returning a 413 status
195 code (Request Entity Too Large), or might successfully accept the chunked request.

196 Because of this lack of conformance of HTTP servers to the HTTP/1.1 standard, the IPP standard
197 [RFC2910] REQUIRES that a conforming IPP Printer object implementation support chunked requests
198 and that conforming clients accept chunked responses. Therefore, IPP object implementers are warned
199 to seek HTTP server implementations that support chunked POST requests in order to conform to the
200 IPP standard and/or use implementation techniques that support chunked POST requests.

201 7.7 HTTP “continue” interim response

202 IPP Clients must be prepared at any time to receive an interim response with a status code of ‘100
203 Continue’. This includes receiving this response prior to sending an IPP request

204 The specific HTTP client and server requirements for ‘100 Continue’ are laid out in section 8.2.3, “Use
205 of the 100 (Continue) Status”, in [RFC2616]. Section 7.8 summarizes the HTTP requirements and
206 provides IPP implementation guidance related to the 100-Continue mechanism and its use.

208 7.8 How can an IPP client Provoke authentication challenges from IPP Printers

209 The IPP operation ‘Validate-Job’ was created to allow clients to confirm that an identical ‘Print-Job’
210 operation (with the document data) would be accepted. The ‘Validate-Job’ also performs the same
211 security negotiation as the ‘Print-Job’ operation. This allows a client to verify that the security
212 requirements can be met and the job template attributes honored before sending any document data.
213 Due to the nature of HTTP connection management there is no guarantee that the client will not be
214 required to re-authenticate on the following operation. Clients that wish to provoke an IPP Printer to
215 issue an authentication challenge prior to sending an IPP operation have the ability to do so.

216 In some cases, a request may be rejected on the basis of the HTTP header alone. (Here, the HTTP
217 "header" includes the HTTP request-line, the HTTP header fields, and the terminating double CRLF.)
218 This is likely to be the case when the requested resource is protected by Digest Authentication: the
219 client needs the "nonce" value from the Printer's challenge in order to form a proper Authorization
220 header field value. In these cases, a client may wish to avoid transmitting the HTTP request body
221 containing the IPP request. For one thing, transmitting a large document for a request, only to have that
222 request rejected on the basis of the HTTP header alone, would be a waste of time and network
223 resources. For another, some clients, especially those transmitting dynamically generated content may
224 find it difficult, inefficient, or even impossible to tell the content generator to back up and regenerate the
225 content from the beginning. The HTTP 100-continue mechanism provides a solution to this problem.
226 The purpose of the 100-continue status is to allow a client that is sending a message with a request body
227 to determine if the Printer is willing to accept the request (based on the HTTP request header) before
228 the client sends the request body.

229 Here is a summary of the rules for HTTP 100-continue:

- 230 • If a client will wait for a 100 (Continue) response before sending the request body, it MUST
231 send an "Expect: 100-continue" header field.
- 232 • If an HTTP request contains an "Expect: 100-continue" header field, the Printer MUST
233 either respond with 100 (Continue) status and continue to read from the input stream, or
234 reject the request with a final HTTP status code.
- 235 • The Printer MUST NOT wait for the request body before sending the 100 (Continue)
236 response.
- 237 • If the Printer responds with a final status code instead of 100 (Continue), it MAY close the
238 connection (preferably, only the Printer's input side of the connection) or it MAY continue to
239 read and discard the rest of the response. It MUST NOT perform the requested method.
- 240 • A Printer SHOULD NOT send a 100 (Continue) response if the request does not include
241 "Expect: 100-continue".
- 242 • A Printer MUST NOT send a 100 (Continue) response to an HTTP/1.0 request. - A
243 Printer MAY omit a 100 (Continue) response if it has already received some of the request
244 body for the corresponding request.
- 245 • A Printer that sends a 100 (Continue) response MUST ultimately send a final status code,
246 once the request body is received and processed, unless it terminates the transport connection
247 prematurely.

248 Some finer points:

- 249 • A client waiting for a 100 (Continue) response SHOULD NOT wait for an indefinite period
250 before sending the request body
- 251 • A client SHOULD ignore any unexpected 100 (Continue) responses.

252

253 The basic algorithm is this:

- 254 1. The client sends an HTTP request header containing the "Expect: 100-continue" header field, but
255 waits before transmitting the request body.

- 256 2. The Printer examines the HTTP header and decides whether or not to accept the HTTP request.
- 257 3. If the Printer accepts the HTTP request, it sends a 100 (Continue) response and continues to read
258 from the input stream.
- 259 4. If the client receives a 100 (Continue) response, it now has a reasonable expectation that the HTTP
260 request will succeed. The client now transmits the request body.
- 261 5. After the Printer receives and processes the request body, it sends a final HTTP status code in
262 response.

263

264 If the Request-URI identifies a resource protected by digest authentication, the flow of events is more
265 like this:

- 266 1. The client sends an HTTP request header containing the "Expect: 100-continue" header field, but
267 waits before transmitting the request body.
- 268 2. The Printer examines the HTTP header and rejects the request with 401 (Unauthorized) status and
269 a "WWW-Authenticate" header field containing at least one challenge.
- 270 3. The client sends a new HTTP request header containing an "Authorization" header field and an
271 "Expect: 100-continue" header field.
- 272 4. If the Printer accepts the new HTTP request, it sends a 100 (Continue) response and continues to
273 read from the input stream.
- 274 5. If the client receives a 100 (Continue) response, it now has a reasonable expectation that the
275 HTTP request will succeed. The client now transmits the request body.
- 276 After the Printer receives and processes the request body, it sends a final HTTP status code in response.

277 Note that a Printer can reject a request at either the HTTP level or the IPP level. E.g., you could get an
278 HTTP (401 Unauthorized) or you could get HTTP 200 (OK) with an IPP client-error-not-authenticated
279 (0x0402). Receiving 100 (Continue) status tells a client that the Printer is willing to accept the HTTP
280 request, but says nothing about whether or not an IPP request (in the body of the HTTP request) will be
281 accepted. A client should use the Validate-Job IPP operation to determine whether or not an IPP Print-
282 Job request will be accepted. Printers MUST always apply the same authorization requirements to
283 Validate-Job as to Print-Job. I.e., if a given Print-Job request would result in a challenge, then so must
284 the corresponding Validate-Job request.

285 Some Printers may authorize access by object, identified by the HTTP Request-URI, while others may
286 authorize access by operation, identified by the IPP "operation-id" request attribute. If a client receives
287 the HTTP 200 (OK)/IPP client-error-not-authenticated (0x0402) combination, it means that the client
288 should look at the Printer's "uri-authentication-supported" and "uri-supported" attributes and look for a
289 more authenticated URI.

290 According to the Digest Authentication standard [RFC2617], the "nonce" value in the Printer's
291 challenge may be good for one use only (for those really paranoid about replay attacks). Therefore, a
292 Printer may issue a challenge for each new request. A client may include an Authorization header
293 preemptively; doing so improves server efficiency and avoids extra round trips for authentication
294 challenges. The Printer may choose to accept the old Authorization header information, even though the
295 nonce value included might not be fresh. Alternatively, the Printer may return a 401 HTTP response
296 with a new nonce value, causing the client to retry the request; by specifying stale=TRUE with this
297 response, the server tells the client to retry with the new nonce, but without prompting for a new
298 username and password.

299 Some clients cannot produce the document data for a Print-Job more than one time, making complete
300 retries impossible. Such clients should use this algorithm to print jobs reliably:

301 1. The client sends an HTTP POST request header containing the "Expect: 100-continue" header
302 field.

303 2. The client waits for a response before transmitting the request body.

304 a) If the client receives a 100 (Continue) response the client transmits an HTTP request body
305 containing a Validate-Job IPP request.

306 b) If the client receives a 401 (Unauthorized) response, it sends a new HTTP POST request
307 header containing an "Authorization" header field with a response the Printer's "WWW-
308 Authenticate" challenge, and goes back to step 2.

309 3. If the client receives an HTTP 200 (OK) response containing an IPP response with one of the
310 success status codes, the client sends an HTTP POST request header containing the "Expect: 100-
311 continue" header field and an "Authorization" header field containing any cached credentials.

312 4. The client waits for a response before transmitting the request body.

313 a) If the client receives a 100 (Continue) response the client transmits an HTTP request body
314 containing a Print-Job IPP request.

315 b) If the client receives a 401 (Unauthorized) response, it sends a new HTTP POST request
316 header containing an "Authorization" header field with a response the Printer's "WWW-
317 Authenticate" challenge, and goes back to step 4.

318

319 It is possible to achieve the same results without using 100-continue, but it takes more round trips.:

320 1. Send a Validate-Job request to provoke a challenge from the Printer.

321 2. If the Printer responds with HTTP 401 (Unauthorized), send another Validate-Job request
322 containing an "Authorization" HTTP header field with a response the Printer's "WWW-Authenticate"
323 challenge, to see if the Print-Job request will be accepted.

324 3. If the Printer accepts the Validate-Job, send another Validate-Job without an "Authorization"
325 header field, to get a fresh nonce.

326 4. Finally, send the Print-Job request containing an "Authorization" HTTP header field with a
327 response the Printer's "WWW-Authenticate" challenge.

328 Note that for this to work, the response to a Printer's "WWW-Authenticate" challenge for Validate-Job
329 must also be valid for Print-Job.

451

452 **10 Description of the Base IPP Documents**

453 In addition to this document, the base set of IPP documents includes:

454 Design Goals for an Internet Printing Protocol [RFC2567]

455 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [RFC2568]

456 Internet Printing Protocol/1.1: Model and Semantics [RFC2911]

457 Internet Printing Protocol/1.1: Encoding and Transport [RFC2910]

458 Mapping between LPD and IPP Protocols [RFC2569]

459

460 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed
 461 printing functionality, and it enumerates real-life scenarios that help to clarify the features that need to
 462 be included in a printing protocol for the Internet. It identifies requirements for three types of users:
 463 end users, operators, and administrators. It calls out a subset of end user requirements that are satisfied
 464 in IPP/1.0 [RFC2566, RFC2565]. A few OPTIONAL operator operations have been added to IPP/1.1
 465 [RFC2911, RFC2910].

466 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document
 467 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of
 468 IPP specification documents, and gives background and rationale for the IETF IPP working group's
 469 major decisions.

470 The "Internet Printing Protocol/1.1: Model and Semantics" document describes a simplified model with
 471 abstract objects, their attributes, and their operations. The model introduces a Printer and a Job. The
 472 Job supports multiple documents per Job. The model document also addresses how security,
 473 internationalization, and directory issues are addressed.

474 The "Internet Printing Protocol/1.1: Encoding and Transport" document is a formal mapping of the
 475 abstract operations and attributes defined in the model document onto HTTP/1.1 [RFC2616]. It also
 476 defines the encoding rules for a new Internet MIME media type called "application/ipp". This document
 477 also defines the rules for transporting a message body over HTTP whose Content-Type is
 478 "application/ipp". This document defines the 'ipp' scheme for identifying IPP printers and jobs.

479 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of
 480 gateways between IPP and LPD (Line Printer Daemon) implementations.
