## 17 Status of this Memo

18 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of  
19 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its  
20 areas, and its working groups. Note that other groups may also distribute working documents as  
21 Internet-Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or  
23 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material  
24 or to cite them other than as "work in progress".

25 ~~To learn the current status of any Internet Draft, please check the "lid-abstracts.txt" listing contained in~~  
26 ~~the~~ The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>

27 The list of Internet-Draft Shadow Directories on <ftp.is.co.za> (Africa), <ftp.nordu.net> (Europe),  
28 <ftp.munnari.oz.au> (Pacific Rim), <ftp.ietf.org> (US East Coast), or <ftp.isi.edu> (US West Coast). can be accessed  
29 as <http://www.ietf.org/shadow.html>.

## 30 31 Abstract

32 This document is one of a set of documents, which together describe all aspects of a new Internet  
33 Printing Protocol (IPP). IPP is an application level protocol that can be used for distributed printing  
34 using Internet tools and technologies. This document describes a simplified model consisting of abstract  
35 objects, their attributes, and their operations that is independent of encoding and transport. The model  
36 consists of a Printer and a Job object. A Job optionally supports multiple documents. IPP ~~1.0~~ 1.1  
37 semantics allow end-users and operators to query printer capabilities, submit print jobs, inquire about the  
38 status of print jobs and printers, cancel, hold, release, and ~~and cancel~~restart print jobs. IPP 1.1 semantics

39 allow operators to pause, resume, and purge (jobs from) Printer objects. This document also addresses  
40 security, internationalization, and directory issues.

41 The full set of IPP documents includes:

- 42 Design Goals for an Internet Printing Protocol [~~IPP-REQ~~][RFC2567]
- 43 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~IPP-~~
- 44 ~~RAT~~][RFC2568]
- 45 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Model and Semantics (this document)
- 46 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Encoding and Transport [IPP-PRO]
- 47 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Implementer's Guide [IPP-IIG]
- 48 Mapping between LPD and IPP Protocols [~~IPP-LPD~~][RFC2569]

49

50 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing  
51 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be  
52 included in a printing protocol for the Internet. It identifies requirements for three types of users: end  
53 users, operators, and administrators. It calls out a subset of end user requirements that are satisfied in  
54 IPP/1.0. Operator and administrator requirements are out of scope for version 1.0. A few OPTIONAL  
55 operator operations have been added to IPP/1.1.

56 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document  
57 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of  
58 IPP specifications, and gives background and rationale for the IETF working group's major decisions.

59 The "Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Encoding and Transport" document is a formal  
60 mapping of the abstract operations and attributes defined in the model document onto HTTP/1.1. It  
61 defines the encoding rules for a new Internet MIME media type called "application/ipp". This document  
62 also defines the rules for transporting over HTTP a message body whose Content-Type is  
63 "application/ipp". This document defines a new scheme named 'ipp' for identifying IPP printers and  
64 jobs. Finally, this document defines interoperability rules for supporting IPP/1.0 clients. Issue 33

65 The "Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Implementer's Guide" document gives insight and  
66 advice to implementers of IPP clients and IPP objects. It is intended to help them understand  
67 IPP/1.0IPP/1.1 and some of the considerations that may assist them in the design of their client and/or  
68 IPP object implementations. For example, a typical order of processing requests is given, including error  
69 checking. Motivation for some of the specification decisions is also included.

70 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of  
71 gateways between IPP and LPD (Line Printer Daemon) implementations.

72

## Table of Contents

73	1. Introduction .....	11
74	1.1 Simplified Printing Model .....	12
75	2. IPP Objects .....	14
76	2.1 Printer Object .....	14
77	2.2 Job Object .....	16
78	2.3 Object Relationships .....	17
79	2.4 Object Identity .....	18
80	3. IPP Operations .....	20
81	3.1 Common Semantics .....	21
82	3.1.1 Required Parameters .....	21
83	3.1.2 Operation IDs and Request IDs .....	22
84	3.1.3 Attributes .....	22
85	3.1.4 Character Set and Natural Language Operation Attributes .....	23
86	3.1.4.1 Request Operation Attributes .....	24
87	3.1.4.2 Response Operation Attributes .....	27
88	3.1.5 Operation Targets .....	28
89	3.1.6 Operation Status Codes and Messages .....	29
90	<u>3.1.7 Unsupported Attributes .....</u>	<u>30</u>
91	3.1.8 Versions .....	31
92	3.1.9 Job Creation Operations .....	32
93	3.2 Printer Operations .....	34
94	3.2.1 Print-Job Operation .....	34
95	3.2.1.1 Print-Job Request .....	35
96	3.2.1.2 Print-Job Response .....	38
97	3.2.2 Print-URI Operation .....	41
98	3.2.3 Validate-Job Operation .....	42
99	3.2.4 Create-Job Operation .....	42
100	3.2.5 Get-Printer-Attributes Operation .....	43
101	3.2.5.1 Get-Printer-Attributes Request .....	43
102	3.2.5.2 Get-Printer-Attributes Response .....	45
103	3.2.6 Get-Jobs Operation .....	46
104	3.2.6.1 Get-Jobs Request .....	46
105	3.2.6.2 Get-Jobs Response .....	48
106	<u>3.2.7 Pause-Printer Operation .....</u>	<u>49</u>
107	<u>3.2.7.1 Pause-Printer Request .....</u>	<u>50</u>
108	<u>3.2.7.2 Pause-Printer Response .....</u>	<u>50</u>
109	<u>3.2.8 Resume-Printer Operation .....</u>	<u>51</u>
110	<u>3.2.9 Purge-Jobs Operation .....</u>	<u>52</u>
111	3.3 Job Operations .....	52
112	3.3.1 Send-Document Operation .....	52
113	3.3.1.1 Send-Document Request .....	54

114	3.3.1.2	Send-Document Response .....	55
115	3.3.2	Send-URI Operation .....	56
116	3.3.3	Cancel-Job Operation .....	56
117	3.3.3.1	Cancel-Job Request .....	57
118	3.3.3.2	Cancel-Job Response .....	57
119	3.3.4	Get-Job-Attributes Operation .....	58
120	3.3.4.1	Get-Job-Attributes Request .....	59
121	3.3.4.2	Get-Job-Attributes Response .....	59
122	<u>3.3.5</u>	<u>Hold-Job Operation .....</u>	<u>60</u>
123	<u>3.3.5.1</u>	<u>Hold-Job Request .....</u>	<u>61</u>
124	<u>3.3.5.2</u>	<u>Hold-Job Response .....</u>	<u>62</u>
125	<u>3.3.6</u>	<u>Release-Job Operation .....</u>	<u>62</u>
126	<u>3.3.7</u>	<u>Restart-Job Operation .....</u>	<u>63</u>
127	<u>3.3.7.1</u>	<u>Restart-Job Request .....</u>	<u>64</u>
128	<u>3.3.7.2</u>	<u>Restart-Job Response .....</u>	<u>65</u>
129	4.	Object Attributes .....	65
130	4.1	Attribute Syntaxes .....	65
131	4.1.1	'text' .....	66
132	4.1.1.1	'textWithoutLanguage' .....	67
133	4.1.1.2	'textWithLanguage' .....	67

341 1. Introduction

342 The Internet Printing Protocol (IPP) is an application level protocol that can be used for distributed  
343 printing using Internet tools and technologies. IPP version ~~1.0 (IPP/1.0)~~ 1.1 (IPP/1.1) focuses only on  
344 end user functionality. This document is just one of a suite of documents that fully define IPP. The full  
345 set of IPP documents includes:

- 346 Design Goals for an Internet Printing Protocol [~~IPP-REQ~~][RFC2567]
- 347 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~IPP-~~  
348 RAT][RFC2568]
- 349 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Model and Semantics (this document)
- 350 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Encoding and Transport [IPP-PRO]
- 351 Internet Printing ~~Protocol/1.0:~~Protocol/1.1: Implementer's Guide [IPP-IIG]
- 352 Mapping between LPD and IPP Protocols [~~IPP-LPD~~][RFC2569]

353  
354 Anyone reading these documents for the first time is strongly encouraged to read the IPP documents in  
355 the above order.

356 This document is laid out as follows:

- 357 - The rest of Section 1 is an introduction to the IPP simplified model for distributed printing.
- 358 - Section 2 introduces the object types covered in the model with their basic behaviors, attributes,  
359 and interactions.
- 360 - Section 3 defines the operations included in ~~IPP/1.0:~~IPP/1.1: IPP operations are synchronous,  
361 therefore, for each operation, there is a both request and a response.
- 362 - Section 4 defines the attributes (and their syntaxes) that are used in the model.
- 363 - Sections 5 - 6 summarizes the implementation conformance requirements for objects that support  
364 the protocol and IANA considerations, respectively.
- 365 - Sections 7 - 12 cover the Internationalization and Security considerations as well as References,  
366 Intellectual Property Notice, Copyright Notice, Author contact information, and Formats for  
367 Registration Proposals.
- 368 - Sections 13 - 15 are appendices that cover Terminology, Status Codes and Messages, and "media"  
369 keyword values.
  - 370 Note: This document uses terms such as "attributes", "keywords", and "support". These
  - 371 terms have special meaning and are defined in the model terminology section 12.2.
  - 372 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD
  - 373 NOT, MAY, NEED NOT, and OPTIONAL, have special meaning relating to
  - 374 conformance. These terms are defined in section 12.1 on conformance terminology, most
  - 375 of which is taken from RFC 2119 [RFC2119].
- 376 - Section 16 is an appendix that helps to clarify the effects of interactions between related attributes  
377 and their values.
- 378 - Section 17 is an appendix that enumerates the subset of Printer attributes that form a generic  
379 directory schema. These attributes are useful when registering a Printer so that a client can find  
380 the Printer not just by name, but by filtered searches as well.

381 - Section 18 is an appendix ~~that provides a Change History~~ summarizing the ~~clarification and changes~~  
382 ~~that might affect an implementation since the June 30, 1998 draft.~~ additions and changes from the  
383 IPP/1.0 "Model and Semantics" specification [RFC2566] to make this IPP/1.1 document.

## 384 1.1 Simplified Printing Model

385 In order to achieve its goal of realizing a workable printing protocol for the Internet, the Internet Printing  
386 Protocol (IPP) is based on a simplified printing model that abstracts the many components of real world  
387 printing solutions. The Internet is a distributed computing environment where requesters of print  
388 services (clients, applications, printer drivers, etc.) cooperate and interact with print service providers.  
389 This model and semantics document describes a simple, abstract model for IPP even though the  
390 underlying configurations may be complex "n-tier" client/server systems. An important simplifying step  
391 in the IPP model is to expose only the key objects and interfaces required for printing. The model  
392 described in this model document does not include features, interfaces, and relationships that are beyond  
393 the scope of the first version of IPP (~~IPP/1.0~~). ~~IPP/1.0~~ (IPP/1.1). IPP/1.1 incorporates many of the  
394 relevant ideas and lessons learned from other specification and development efforts [HTPP] [ISO10175]  
395 [LDPA] [P1387.4] [PSIS] [RFC1179] [SWP]. IPP is heavily influenced by the printing model  
396 introduced in the Document Printing Application (DPA) [ISO10175] standard. Although DPA specifies  
397 both end user and administrative features, IPP version ~~1.0 (IPP/1.0) focuses only on end user~~  
398 functionality.

399 1.1 (IPP/1.1) focuses primarily on end user functionality with a few additional OPTIONAL operator  
400 operations.

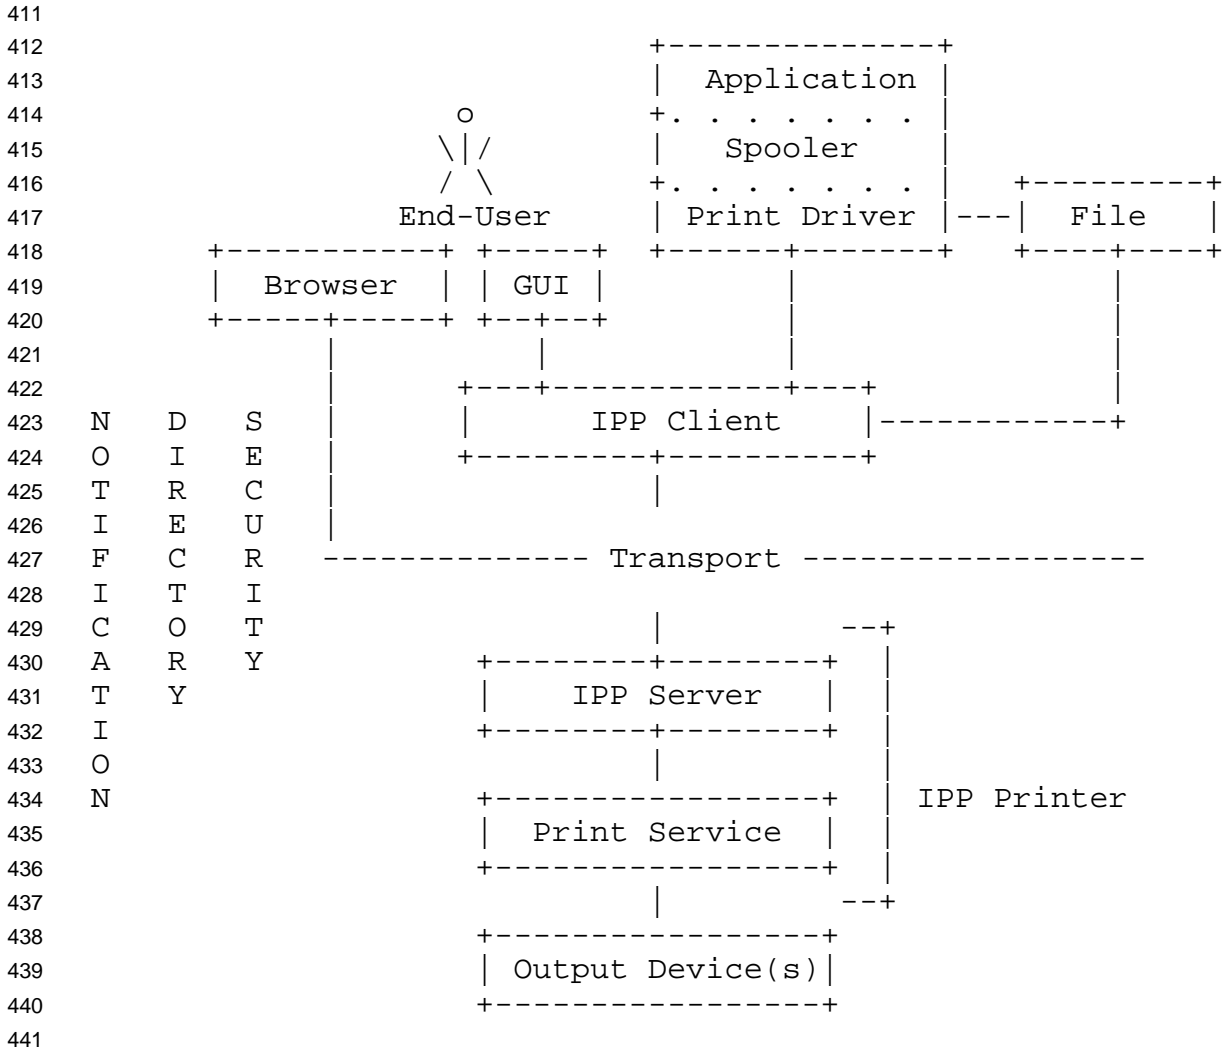

401 The ~~IPP/1.0~~ IPP/1.1 model encapsulates the important components of distributed printing into two object  
402 types:

- 403 - Printer (Section 2.1)
- 404 - Job (Section 2.2)

405

406 Each object type has an associated set of operations (see section 3) and attributes (see section 4).

407 It is important, however, to understand that in real system implementations (which lie underneath the  
408 abstracted ~~IPP/1.0~~ IPP/1.1 model), there are other components of a print service which are not explicitly  
409 defined in the ~~IPP/1.0~~ IPP/1.1 model. The following figure illustrates where ~~IPP/1.0~~ IPP/1.1 fits with  
410 respect to these other components.

442 An IPP Printer object encapsulates the functions normally associated with physical output devices along  
443 with the spooling, scheduling and multiple device management functions often associated with a print  
444 server. Printer objects are optionally registered as entries in a directory where end users find and select  
445 them based on some sort of filtered and context based searching mechanism (see section 16). The  
446 directory is used to store relatively static information about the Printer, allowing end users to search for  
447 and find Printers that match their search criteria, for example: name, context, printer capabilities, etc.  
448 The more dynamic information, such as state, currently loaded and ready media, number of jobs at the  
449 Printer, errors, warnings, and so forth, is directly associated with the Printer object itself rather than with  
450 the entry in the directory which only represents the Printer object.

451 IPP clients implement the IPP protocol on the client side and give end users (or programs running on  
452 behalf of end users) the ability to query Printer objects and submit and manage print jobs. An IPP server  
453 is just that part of the Printer object that implements the server-side protocol. The rest of the Printer  
454 object implements (or gateways into) the application semantics of the print service itself. The Printer  
455 objects may be embedded in an output device or may be implemented on a host on the network that  
456 communicates with an output device.

457 When a job is submitted to the Printer object and the Printer object validates the attributes in the  
458 submission request, the Printer object creates a new Job object. The end user then interacts with this  
459 new Job object to query its status and monitor the progress of the job. ~~End users may also cancel the~~  
460 ~~print job~~ An end user can also cancel their print jobs by using the Job object's Cancel-Job operation. An  
461 end-user can also hold, release, and restart their print jobs using the Job object's OPTIONAL Hold-Job,  
462 Release-Job, and Restart-Job operations, if implemented.

463 A privileged operator or administrator of a Printer object can cancel, hold, release, and restart any user's  
464 job using the REQUIRED Cancel-Job and the OPTIONAL Hold-Job, Release-Job, and Restart-Job  
465 operations. In additional privileged operator or administrator of a Printer object can pause, resume, or  
466 purge (jobs from) a Printer object using the OPTIONAL Pause-Printer, Resume-Printer, and Purge-Jobs  
467 operations, if implemented.

468 The notification service is out of scope for ~~IPP/1.0~~ this IPP/1.1 specification, but using such a  
469 notification service, the end user is able to register for and receive Printer specific and Job specific  
470 events. An end user can query the status of Printer objects and can follow the progress of Job objects by  
471 polling using the Get-~~Printer-Attributes, Printer-Attributes,~~ Get-Jobs, and Get-Job-Attributes operations.

## 472 2. IPP Objects

473 The ~~IPP/1.0~~ IPP/1.1 model introduces objects of type Printer and Job. Each type of object models  
474 relevant aspects of a real-world entity such as a real printer or real print job. Each object type is defined  
475 as a set of possible attributes that may be supported by instances of that object type. For each object  
476 (instance), the actual set of supported attributes and values describe a specific implementation. The  
477 object's attributes and values describe its state, capabilities, realizable features, job processing functions,  
478 and default behaviors and characteristics. For example, the Printer object type is defined as a set of  
479 attributes that each Printer object potentially supports. In the same manner, the Job object type is  
480 defined as a set of attributes that are potentially supported by each Job object.

481 Each attribute included in the set of attributes defining an object type is labeled as:

- 482 - "REQUIRED": each object MUST support the attribute.
- 483 - "OPTIONAL": each object MAY support the attribute.

484

485 There is no such similar labeling of attribute values. However, if an implementation supports an  
486 attribute, it MUST support at least one of the possible values for that attribute.

### 487 2.1 Printer Object

488 The major component of the ~~IPP/1.0~~ IPP/1.1 model is the Printer object. A Printer object implements the  
489 server-side of the ~~IPP/1.0~~ IPP/1.1 protocol. Using the protocol, end users may query the attributes of the  
490 Printer object and submit print jobs to the Printer object. The actual implementation components behind  
491 the Printer abstraction may take on different forms and different configurations. However, the model

492 abstraction allows the details of the configuration of real components to remain opaque to the end user.  
493 Section 3 describes each of the Printer operations in detail.

494 The capabilities and state of a Printer object are described by its attributes. Printer attributes are divided  
495 into two groups:

- 496 - "job-template" attributes: These attributes describe supported job processing capabilities and  
497 defaults for the Printer object. (See section 4.2)
  - 498 - "printer-description" attributes: These attributes describe the Printer object's identification, state,  
499 location, references to other sources of information about the Printer object, etc. (see section 4.4)
- 500

501 Since a Printer object is an abstraction of a generic document output device and print service provider, a  
502 Printer object could be used to represent any real or virtual device with semantics consistent with the  
503 Printer object, such as a fax device, an imager, or even a CD writer.

504 Some examples of configurations supporting a Printer object include:

- 505 1) An output device with no spooling capabilities
  - 506 2) An output device with a built-in spooler
  - 507 3) A print server supporting IPP with one or more associated output devices
  - 508 3a) The associated output devices may or may not be capable of spooling jobs
  - 509 3b) The associated output devices may or may not support IPP
- 510

511 The following figures show some examples of how Printer objects can be realized on top of various  
512 distributed printing configurations. The embedded case below represents configurations 1 and 2. The  
513 hosted and fan-out figures below represent configurations 3a and 3b.

514 In this document the term "client" refers to a software entity that sends IPP operation request to an IPP  
515 Printer object and accepts IPP operation responses. A client MAY be:

- 516 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
517 application and/or
- 518 2. a component of a print server that communicates (using IPP operations) with either an output  
519 device or another "downstream" print server.

520 The term "IPP Printer" is a network entity that accepts IPP operation requests and returns IPP operation  
521 responses. As such, an IPP object MAY be:

- 522 1. (embedded) software that controls a device
- 523 2. part of a print server that accepts IPP operation requests and, in turn, sends operation requests  
524 using (the IPP or other) protocol to one or more networked device(s).

525

526 Legend:

527  
528 ##### indicates a Printer object which is  
529 either embedded in an output device or is  
530 hosted in a server. The Printer object  
531 might or might not be capable of queuing/spooling.

532  
533 any indicates any network protocol or direct  
534 connect, including IPP

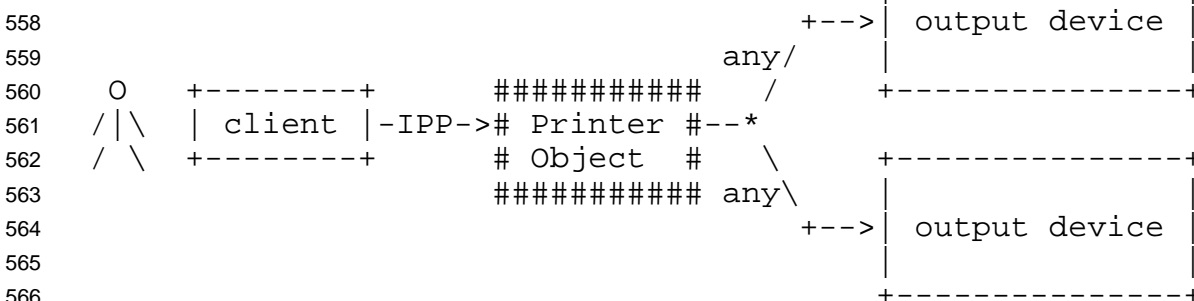

535  
536  
537 embedded printer:

545  
546  
547 hosted printer:

554  
555  
556  
557 fan out:

567  
568  
569 2.2 Job Object

570 A Job object is used to model a print job. A Job object contains documents. The information required  
571 to create a Job object is sent in a create request from the end user via an IPP Client to the Printer object.

572 The Printer object validates the create request, and if the Printer object accepts the request, the Printer  
573 object creates the new Job object. Section 3 describes each of the Job operations in detail.

574 The characteristics and state of a Job object are described by its attributes. Job attributes are grouped  
575 into two groups as follows:

- 576 - "job-template" attributes: These attributes can be supplied by the client or end user and include job  
577 processing instructions which are intended to override any Printer object defaults and/or  
578 instructions embedded within the document data. (See section 4.2)
- 579 - "job-description" attributes: These attributes describe the Job object's identification, state, size, etc.  
580 The client supplies some of these attributes, and the Printer object generates others. (See section  
581 4.3)

582  
583 An implementation **MUST** support at least one document per Job object. An implementation **MAY**  
584 support multiple documents per Job object. A document is either:

- 585 - a stream of document data in a format supported by the Printer object (typically a Page Description  
586 Language - PDL), or
- 587 - a reference to such a stream of document data

588  
589 In ~~IPP/1.0~~, IPP/1.1, a document is not modeled as an IPP object, therefore it has no object identifier or  
590 associated attributes. All job processing instructions are modeled as Job object attributes. These  
591 attributes are called Job Template attributes and they apply equally to all documents within a Job object.

## 592 2.3 Object Relationships

593 IPP objects have relationships that are maintained persistently along with the persistent storage of the  
594 object attributes.

595 A Printer object can represent either one or more physical output devices or a logical device which  
596 "processes" jobs but never actually uses a physical output device to put marks on paper. Examples of  
597 logical devices include a Web page publisher or a gateway into an online document archive or  
598 repository. A Printer object contains zero or more Job objects.

599 A Job object is contained by exactly one Printer object, however the identical document data associated  
600 with a Job object could be sent to either the same or a different Printer object. In this case, a second Job  
601 object would be created which would be almost identical to the first Job object, however it would have  
602 new (different) Job object identifiers (see section 2.4).

603 A Job object is either empty (before any documents have been added) or contains one or more  
604 documents. If the contained document is a stream of document data, that stream can be contained in  
605 only one document. However, there can be identical copies of the stream in other documents in the same  
606 or different Job objects. If the contained document is just a reference to a stream of document data,  
607 other documents (in the same or different Job object(s)) may contain the same reference.

608 2.4 Object Identity

609 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they  
610 can be persistently and unambiguously referenced. The notion of a URI is a useful concept, however,  
611 until the notion of URI is more stable (i.e., defined more completely and deployed more widely), it is  
612 expected that the URIs used for IPP objects will actually be URLs [RFC2396]. Since every URL is a  
613 specialized form of a URI, even though the more generic term URI is used throughout the rest of this  
614 document, its usage is intended to cover the more specific notion of URL as well.

615 An administrator configures Printer objects to either support or not support authentication and/or  
616 message privacy using ~~SSL3 [SSL]~~ TLS [TLS] (the mechanism for security configuration is outside the  
617 scope of ~~IPP/1.0~~ this IPP/1.1 document). In some situations, both types of connections (both  
618 authenticated and unauthenticated) can be established using a single communication channel that has  
619 some sort of negotiation mechanism. In other situations, multiple communication channels are used, one  
620 for each type of security configuration. Section 8 provides a full description of all security  
621 considerations and configurations.

622 If a Printer object supports more than one communication channel, some or all of those channels might  
623 support and/or require different security mechanisms. In such cases, an administrator could expose the  
624 simultaneous support for these multiple communication channels as multiple URIs for a single Printer  
625 object where each URI represents one of the communication channels to the Printer object. To support  
626 this flexibility, the IPP Printer object type defines a multi-valued identification attribute called the  
627 "printer-uri-supported" attribute. It MUST contain at least one URI. It MAY contain more than one  
628 URI. That is, every Printer object will have at least one URI that identifies at least one communication  
629 channel to the Printer object, but it may have more than one URI where each URI identifies a different  
630 communication channel to the Printer object. The "printer-uri-supported" attribute has at two companion  
631 attributes, the "uri-security-supported" attribute and the "uri-authentication-supported".  
632 Both have the same cardinality as "printer-uri-supported". The purpose of the "uri-security-supported"  
633 attribute is to indicate the security mechanisms (if any) used for each URI listed in "printer-uri-  
634 supported". The purpose of the "uri-authentication-supported" attribute is to indicate the authentication  
635 mechanisms (if any) used for each URI listed in "printer-uri-supported". These ~~two~~ three attributes are  
636 fully described in sections 4.4.1 ~~and~~, 4.4.2, ~~and~~ 4.4.3. Issue 2

637 When a job is submitted to the Printer object via a create request, the client supplies only a single Printer  
638 object URI. The client supplied Printer object URI MUST be one of the values in the "printer-uri-  
639 supported" Printer attribute.

640 Note: ~~IPP/1.0~~ IPP/1.1 does not specify how the client obtains the client supplied URI, but it is  
641 RECOMMENDED that a Printer object be registered as an entry in a directory service. End-users and  
642 programs can then interrogate the directory searching for Printers. Section 16 defines a generic schema  
643 for Printer object entries in the directory service and describes how the entry acts as a bridge to the actual  
644 IPP Printer object. The entry in the directory that represents the IPP Printer object includes the possibly  
645 many URIs for that Printer object as values in one its attributes.

646 When a client submits a create request to the Printer object, the Printer object validates the request and  
647 creates a new Job object. The Printer object assigns the new Job object a URI which is stored in the

648 "job-uri" Job attribute. This URI is then used by clients as the target for subsequent Job operations. The  
649 Printer object generates a Job URI based on its configured security policy and the URI used by the client  
650 in the create request.

651 For example, consider a Printer object that supports both a communication channel secured by the use of  
652 SSL3 (using HTTP over SSL3 with an "https" schemed URI) and another open communication channel  
653 that is not secured with SSL3 (using a simple "http" schemed URI). If a client were to submit a job  
654 using the secure URI, the Printer object would assign the new Job object a secure URI as well. If a client  
655 were to submit a job using the open-channel URI, the Printer would assign the new Job object an open-  
656 channel URI.

657 In addition, the Printer object also populates the Job object's "job-printer-uri" attribute. This is a  
658 reference back to the Printer object that created the Job object. If a client only has access to a Job  
659 object's "job-uri" identifier, the client can query the Job's "job-printer-uri" attribute in order to determine  
660 which Printer object created the Job object. If the Printer object supports more than one URI, the Printer  
661 object picks the one URI supplied by the client when creating the job to build the value for and to  
662 populate the Job's "job-printer-uri" attribute.

663 Allowing Job objects to have URIs allows for flexibility and scalability. For example, in some  
664 implementations, the Printer object might create Jobs that are processed in the same local environment  
665 as the Printer object itself. In this case, the Job URI might just be a composition of the Printer's URI and  
666 some unique component for the Job object, such as the unique 32-bit positive integer mentioned later in  
667 this paragraph. In other implementations, the Printer object might be a central clearing-house for  
668 validating all Job object creation requests, but the Job object itself might be created in some environment  
669 that is remote from the Printer object. In this case, the Job object's URI may have no physical-location  
670 relationship at all to the Printer object's URI. Again, the fact that Job objects have URIs allows for  
671 flexibility and scalability, however, many existing printing systems have local models or interface  
672 constraints that force print jobs to be identified using only a 32-bit positive integer rather than an  
673 independent URI. This numeric Job ID is only unique within the context of the Printer object to which  
674 the create request was originally submitted. Therefore, in order to allow both types of client access to  
675 IPP Job objects (either by Job URI or by numeric Job ID), when the Printer object successfully processes  
676 a create request and creates a new Job object, the Printer object MUST generate both a Job URI and a  
677 Job ID. The Job ID (stored in the "job-id" attribute) only has meaning in the context of the Printer object  
678 to which the create request was originally submitted. This requirement to support both Job URIs and Job  
679 IDs allows all types of clients to access Printer objects and Job objects no matter the local constraints  
680 imposed on the client implementation.

681 In addition to identifiers, Printer objects and Job objects have names ("printer-name" and "job-name").  
682 An object name NEED NOT be unique across all instances of all objects. A Printer object's name is  
683 chosen and set by an administrator through some mechanism outside the scope of ~~IPP/1.0~~ this IPP/1.1  
684 document. A Job object's name is optionally chosen and supplied by the IPP client submitting the job.  
685 If the client does not supply a Job object name, the Printer object generates a name for the new Job  
686 object. In all cases, the name only has local meaning.

687 To summarize:

- 688 - Each Printer object is identified with one or more URIs. The Printer's "printer-uri-supported"  
689 attribute contains the URI(s).
- 690 - The Printer object's "uri-security-supported" attribute identifies the communication channel security  
691 protocols that may or may not have been configured for the various Printer object URIs (e.g.,  
692 'ssl3' or 'tls' or 'none').
- 693 - - The Printer object's "uri-authentication-supported" attribute identifies the authentication  
694 mechanisms that may or may not have been configured for the various Printer object URIs (e.g.,  
695 'digest' or 'none').
- 696 - Each Job object is identified with a Job URI. The Job's "job-uri" attribute contains the URI.
- 697 - Each Job object is also identified with Job ID which is a 32-bit, positive integer. The Job's "job-id"  
698 attribute contains the Job ID. The Job ID is only unique within the context of the Printer object  
699 which created the Job object.
- 700 - Each Job object has a "job-printer-uri" attribute which contains the URI of the Printer object that  
701 was used to create the Job object. This attribute is used to determine the Printer object that  
702 created a Job object when given only the URI for the Job object. This linkage is necessary to  
703 determine the languages, charsets, and operations which are supported on that Job (the basis for  
704 such support comes from the creating Printer object).
- 705 - Each Printer object has a name (which is not necessarily unique). The administrator chooses and  
706 sets this name through some mechanism outside the scope of ~~IPP/1.0~~ this IPP/1.1  
707 document. The Printer object's "printer-name" attribute contains the name.
- 708 - Each Job object has a name (which is not necessarily unique). The client optionally supplies this  
709 name in the create request. If the client does not supply this name, the Printer object generates a  
710 name for the Job object. The Job object's "job-name" attribute contains the name.

### 711 3. IPP Operations

712 IPP objects support operations. An operation consists of a request and a response. When a client  
713 communicates with an IPP object, the client issues an operation request to the URI for that object.  
714 Operation requests and responses have parameters that identify the operation. Operations also have  
715 attributes that affect the run-time characteristics of the operation (the intended target, localization  
716 information, etc.). These operation-specific attributes are called operation attributes (as compared to  
717 object attributes such as Printer object attributes or Job object attributes). Each request carries along  
718 with it any operation attributes, object attributes, and/or document data required to perform the  
719 operation. Each request requires a response from the object. Each response indicates success or failure  
720 of the operation with a status code as a response parameter. The response contains any operation  
721 attributes, object attributes, and/or status messages generated during the execution of the operation  
722 request.

723 This section describes the semantics of the IPP operations, both requests and responses, in terms of the  
724 parameters, attributes, and other data associated with each operation.

725 The ~~IPP/1.0~~ IPP/1.1 Printer operations are:

- 726 Print-Job (section 3.2.1)  
727 Print-URI (section 3.2.2)

728 Validate-Job (section 3.2.3)  
729 Create-Job (section 3.2.4)  
730 Get-Printer-Attributes (section 3.2.5)  
731 Get-Jobs (section 3.2.6)  
732 Pause-Printer (section 3.3.5)  
733 Resume-Printer (section 3.3.6)  
734 Purge-Jobs (section 3.3.7)  
735

736 The Job operations are:

737 Send-Document (section 3.3.1)  
738 Send-URI (section 3.3.2)  
739 Cancel-Job (section 3.3.3)  
740 Get-Job-Attributes (section 3.3.4)  
741 Hold-Job (section 3.3.5)  
742 Release-Job (section 3.3.6)  
743 Restart-Job (section 3.3.7)  
744

745 The Send-Document and Send-URI Job operations are used to add a new document to an existing multi-  
746 document Job object created using the Create-Job operation.

### 747 3.1 Common Semantics

748 All IPP operations require some common parameters and operation attributes. These common elements  
749 and their semantic characteristics are defined and described in more detail in the following sections.

#### 750 3.1.1 Required Parameters

751 Every operation request contains the following REQUIRED parameters:

- 752 - a "version-number",
  - 753 - an "operation-id",
  - 754 - a "request-id", and
  - 755 - the attributes that are REQUIRED for that type of request.
- 756

757 Every operation response contains the following REQUIRED parameters:

- 758 - a "version-number",
  - 759 - a "status-code",
  - 760 - the "request-id" that was supplied in the corresponding request, and
  - 761 - the attributes that are REQUIRED for that type of response.
- 762

763 The ~~encoding and transport~~ Encoding and Transport document [IPP-PRO] defines special rules for the  
764 encoding of these parameters. All other operation elements are represented using the more generic  
765 encoding rules for attributes and groups of attributes.

766 3.1.2 Operation IDs and Request IDs

767 Each IPP operation request includes an identifying "operation-id" value. Valid values are defined in the  
768 "operations-supported" Printer attribute section (see section 4.4.15). The client specifies which  
769 operation is being requested by supplying the correct "operation-id" value.

770 In addition, every invocation of an operation is identified by a "request-id" value. For each request, the  
771 client chooses the "request-id" which MUST be an integer (possibly unique depending on client  
772 requirements) in the range from 1 to  $2^{31} - 1$  (inclusive). This "request-id" allows clients to manage  
773 multiple outstanding requests. The receiving IPP object copies all 32-bits of the client-supplied "request-  
774 id" attribute into the response so that the client can match the response with the correct outstanding  
775 request, even if the "request-id" is out of range. If the request is terminated before the complete  
776 "request-id" is received, the IPP object rejects the request and returns a response with a "request-id" of 0.

777 Note: In some cases, the transport protocol underneath IPP might be a connection oriented protocol that  
778 would make it impossible for a client to receive responses in any order other than the order in which the  
779 corresponding requests were sent. In such cases, the "request-id" attribute would not be essential for  
780 correct protocol operation. However, in other mappings, the operation responses can come back in any  
781 order. In these cases, the "request-id" would be essential.

782 3.1.3 Attributes

783 Operation requests and responses are both composed of groups of attributes and/or document data. The  
784 attributes groups are:

- 785 - Operation Attributes: These attributes are passed in the operation and affect the IPP object's  
786 behavior while processing the operation request and may affect other attributes or groups of  
787 attributes. Some operation attributes describe the document data associated with the print job  
788 and are associated with new Job objects, however most operation attributes do not persist beyond  
789 the life of the operation. The description of each operation attribute includes conformance  
790 statements indicating which operation attributes are REQUIRED and which are OPTIONAL for  
791 an IPP object to support and which attributes a client MUST supply in a request and an IPP  
792 object MUST supply in a response.
- 793 - Job Template Attributes: These attributes affect the processing of a job. A client OPTIONALLY  
794 supplies Job Template Attributes in a create request, and the receiving object MUST be prepared  
795 to receive all supported attributes. The Job object can later be queried to find out what Job  
796 Template attributes were originally requested in the create request, and such attributes are  
797 returned in the response as Job Object Attributes. The Printer object can be queried about its Job  
798 Template attributes to find out what type of job processing capabilities are supported and/or what  
799 the default job processing behaviors are, though such attributes are returned in the response as  
800 Printer Object Attributes. The "ipp-attribute-fidelity" operation attribute affects processing of all  
801 client-supplied Job Template attributes (see sections 3.2.1.2 and 15 for a full description of "ipp-  
802 attribute-fidelity" and its relationship to other attributes).
- 803 - Job Object Attributes: These attributes are returned in response to a query operation directed at a  
804 Job object.

- 805 - Printer Object Attributes: These attributes are returned in response to a query operation directed at a  
806 Printer object.
- 807 - Unsupported Attributes: In a create request, the client supplies a set of Operation and Job Template  
808 attributes. If any of these attributes or their values is unsupported by the Printer object, the  
809 Printer object returns the set of unsupported attributes in the response. Sections 3.1.7, 3.2.1.2,  
810 and 15 give a full description of how Job Template attributes supplied by the client in a create  
811 request are processed by the Printer object and how unsupported attributes are returned to the  
812 client. Because of extensibility, any IPP object might receive a request that contains new or  
813 unknown attributes or values for which it has no support. In such cases, the IPP object processes  
814 what it can and returns the unsupported attributes in the response. The Unsupported Attribute  
815 group is defined for all operation responses for returning unsupported attributes that the client  
816 supplied in the request. Issue  
817

818 Later in this section, each operation is formally defined by identifying the allowed and expected groups  
819 of attributes for each request and response. The model identifies a specific order for each group in each  
820 request or response, but the attributes within each group may be in any order, unless specified otherwise.

821 Each attribute specification includes the attribute's name followed by the name of its attribute syntax(es)  
822 in parentheses. In addition, each 'integer' attribute is followed by the allowed range in parentheses,  
823 (m:n), for values of that attribute. Each 'text' or 'name' attribute is followed by the maximum size in  
824 octets in parentheses, (size), for values of that attribute. For more details on attribute syntax notation, see  
825 the descriptions of these attributes syntaxes in section 4.1.

826 Note: Document data included in the operation is not strictly an attribute, but it is treated as a special  
827 attribute group for ordering purposes. The only operations that support supplying the document data  
828 within an operation request are Print-Job and Send-Document. There are no operation responses that  
829 include document data.

830 Note: Some operations are REQUIRED for IPP objects to support; the others are OPTIONAL (see  
831 section 5.2.2). Therefore, before using an OPTIONAL operation, a client SHOULD first use the  
832 REQUIRED Get-Printer-Attributes operation to query the Printer's "operations-supported" attribute in  
833 order to determine which OPTIONAL Printer and Job operations are actually supported. The client  
834 SHOULD NOT use an OPTIONAL operation that is not supported. When an IPP object receives a  
835 request to perform an operation it does not support, it returns the 'server-error-operation-not-supported'  
836 status code (see section 13.1.5.2). An IPP object is non-conformant if it does not support a REQUIRED  
837 operation.

#### 838 3.1.4 Character Set and Natural Language Operation Attributes

839 Some Job and Printer attributes have values that are text strings and names intended for human  
840 understanding rather than machine understanding (see the 'text' and 'name' attribute syntax descriptions  
841 in section 4.1). The following sections describe two special Operation Attributes called "attributes-  
842 charset" and "attributes-natural-language". These attributes are always part of the Operation Attributes  
843 group. For most attribute groups, the order of the attributes within the group is not important. However,  
844 for these two attributes within the Operation Attributes group, the order is critical. The "attributes-

845 charset" attribute MUST be the first attribute in the group and the "attributes-natural-language" attribute  
846 MUST be the second attribute in the group. In other words, these attributes MUST be supplied in every  
847 IPP request and response, they MUST come first in the group, and MUST come in the specified order.  
848 For job creation operations, the IPP Printer implementation saves these two attributes with the new Job  
849 object as Job Description attributes. For the sake of brevity in this document, these operation attribute  
850 descriptions are not repeated with every operation request and response, but have a reference back to this  
851 section instead.

#### 852 3.1.4.1 Request Operation Attributes

853 The client MUST supply and the Printer object MUST support the following REQUIRED operation  
854 attributes in every ~~IPP/1.0~~IPP/1.1 operation request:

855 "attributes-charset" (charset):

856 This operation attribute identifies the charset (coded character set and encoding method) used by  
857 any 'text' and 'name' attributes that the client is supplying in this request. It also identifies the  
858 charset that the Printer object MUST use (if supported) for all 'text' and 'name' attributes and  
859 status messages that the Printer object returns in the response to this request. See Sections 4.1.1  
860 and 4.1.2 for the specification of the 'text' and 'name' attribute syntaxes.

861  
862 All clients and IPP objects MUST support the 'utf-8' charset [~~RFC2044~~][RFC2279] and MAY  
863 support additional charsets provided that they are registered with IANA [IANA-CS]. If the  
864 Printer object does not support the client supplied charset value, the Printer object MUST reject  
865 the request, set the "attributes-charset" to 'utf-8' in the response, and return the 'client-error-  
866 charset-not-supported' status code and any 'text' or 'name' attributes using the 'utf-8' charset. The  
867 Printer **NEED NOT return any attributes in the Unsupported Attributes Group (See sections 3.1.7**  
868 **and 3.2.1.2).** **The Printer** object MUST indicate the charset(s) supported as the values of the  
869 "charset-supported" Printer attribute (see Section 4.4.18), so that the client can query to  
870 determine which charset(s) are supported.

871  
872 Note to client implementers: Since IPP objects are only required to support the 'utf-8' charset, in  
873 order to maximize interoperability with multiple IPP object implementations, a client may want  
874 to supply 'utf-8' in the "attributes-charset" operation attribute, even though the client is only  
875 passing and able to present a simpler charset, such as US-ASCII or ISO-8859-1. Then the client  
876 will have to filter out (or charset convert) those characters that are returned in the response that it  
877 cannot present to its user. On the other hand, if both the client and the IPP objects also support a  
878 charset in common besides utf-8, the client may want to use that charset in order to avoid charset  
879 conversion or data loss.

880  
881 See the 'charset' attribute syntax description in Section 4.1.7 for the syntax and semantic  
882 interpretation of the values of this attribute and for example values.

883  
884 "attributes-natural-language" (naturalLanguage):

885 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
886 the client is supplying in this request. This attribute also identifies the natural language that the

887 Printer object SHOULD use for all 'text' and 'name' attributes and status messages that the Printer  
888 object returns in the response to this request.

889  
890 There are no REQUIRED natural languages required for the Printer object to support. However,  
891 the Printer object's "generated-natural-language-supported" attribute identifies the natural  
892 languages supported by the Printer object and any contained Job objects for all text strings  
893 generated by the IPP object. A client MAY query this attribute to determine which natural  
894 language(s) are supported for generated messages.

895  
896 For any of the attributes for which the Printer object generates text, i.e., for the "job-state-  
897 message", "printer-state-message", and status messages (see Section 3.1.6), the Printer object  
898 MUST be able to generate these text strings in any of its supported natural languages. If the  
899 client requests a natural language that is not supported, the Printer object MUST return these  
900 generated messages in the Printer's configured natural language as specified by the Printer's  
901 "natural-language-configured" attribute" (see Section 4.4.19).

902  
903 For other 'text' and 'name' attributes supplied by the client, authentication system, operator,  
904 system administrator, or manufacturer (i.e., for "job-originating-user-name", "printer-name"  
905 (name), "printer-location" (text), "printer-info" (text), and "printer-make-and-model" (text)), the  
906 Printer object is only required to support the configured natural language of the Printer identified  
907 by the Printer object's "natural-language-configured" attribute, though support of additional  
908 natural languages for these attributes is permitted.

909  
910 For any 'text' or 'name' attribute in the request that is in a different natural language than the value  
911 supplied in the "attributes-natural-language" operation attribute, the client MUST use the Natural  
912 Language Override mechanism (see sections 4.1.1.2 and 4.1.2.2) for each such attribute value  
913 supplied. The client MAY use the Natural Language Override mechanism redundantly, i.e., use  
914 it even when the value is in the same natural language as the value supplied in the "attributes-  
915 natural-language" operation attribute of the request.

916  
917 The IPP object MUST accept any natural language and any Natural Language Override, whether  
918 the IPP object supports that natural language or not (and independent of the value of the "ipp-  
919 attribute-fidelity" Operation attribute). That is the IPP object accepts all client supplied values no  
920 matter what the values are in the Printer object's "generated-natural-language-supported"  
921 attribute. That attribute, "generated-natural-language-supported", only applies to generated  
922 messages, not client supplied messages. The IPP object MUST remember that natural language  
923 for all client-supplied attributes, and when returning those attributes in response to a query, the  
924 IPP object MUST indicate that natural language.

925  
926 Each value whose attribute syntax type is ~~'text' or 'name'~~ 'text' or 'name' (see sections 4.1.1 and  
927 4.1.2) has an Associated Natural-Language. This document does not specify how this association  
928 is stored in a Printer or Job object. When such a value is encoded in a request or response, the  
929 natural language is either implicit or explicit:

930

- 931           – In the implicit case, the value contains only the text/name value, and the language is  
932           specified by the ~~"attributes-natural-language"~~"attributes-natural-language" operation  
933           attribute in the request or response (see sections 4.1.1.1 textWithoutLanguage and 4.1.2.1  
934           nameWithoutLanguage).
- 935
- 936           – In the explicit case (also known as the Natural-Language Override case), the value  
937           contains both the language and the text/name value (see sections 4.1.1.2  
938           textWithLanguage and 4.1.2.2 nameWithLanguage).

939  
940       For example, the "job-name" attribute MAY be supplied by the client in a create request. The  
941       text value for this attribute will be in the natural language identified by the "attribute-natural-  
942       language" attribute, or if different, as identified by the Natural Language Override mechanism. If  
943       supplied, the IPP object will use the value of the "job-name" attribute to populate the Job object's  
944       "job-name" attribute. Whenever any client queries the Job object's "job-name" attribute, the IPP  
945       object returns the attribute as stored and uses the Natural Language Override mechanism to  
946       specify the natural language, if it is different from that reported in the "attributes-natural-  
947       language" operation attribute of the response. The IPP object MAY use the Natural Language  
948       Override mechanism redundantly, i.e., use it even when the value is in the same natural language  
949       as the value supplied in the "attributes-natural-language" operation attribute of the response.

950  
951       An IPP object MUST NOT reject a request based on a supplied natural language in an  
952       "attributes-natural-language" Operation attribute or in any attribute that uses the Natural  
953       Language Override.

954  
955       See the 'naturalLanguage' attribute syntax description in section 4.1.8 for the syntax and semantic  
956       interpretation of the values of this attribute and for example values.

957  
958       Clients SHOULD NOT supply 'text' or 'name' attributes that use an illegal combination of natural  
959       language and charset. For example, suppose a Printer object supports charsets 'utf-8', 'iso-8859-1', and  
960       'iso-8859-7'. Suppose also, that it supports natural languages 'en' (English), 'fr' (French), and 'el' (Greek).  
961       Although the Printer object supports the charset 'iso-8859-1' and natural language 'el', it probably does  
962       not support the combination of Greek text strings using the 'iso-8859-1' charset. The Printer object  
963       handles this apparent incompatibility differently depending on the context in which it occurs:

- 964       - In a create request: If the client supplies a text or name attribute (for example, the "job-name"  
965       operation attribute) that uses an apparently incompatible combination, it is a client choice that  
966       does not affect the Printer object or its correct operation. Therefore, the Printer object simply  
967       accepts the client supplied value, stores it with the Job object, and responds back with the same  
968       combination whenever the client (or any client) queries for that attribute.
- 969       -In a query-type operation, like Get-Printer-Attributes: If the client requests an apparently  
970       incompatible combination, the Printer object responds (as described in section 3.1.4.2) using the  
971       Printer's configured natural language rather than the natural language requested by the client.

972  
973       In either case, the Printer object does not reject the request because of the apparent incompatibility. The  
974       potential incompatible combination of charset and natural language can occur either at the global

975 operation level or at the Natural Language Override attribute-by-attribute level. In addition, since the  
976 response always includes explicit charset and natural language information, there is never any question  
977 or ambiguity in how the client interprets the response.

#### 978 3.1.4.2 Response Operation Attributes

979 The Printer object MUST supply and the client MUST support the following REQUIRED operation  
980 attributes in every ~~IPP/1.0~~ IPP/1.1 operation response:

981 "attributes-charset" (charset):

982 This operation attribute identifies the charset used by any 'text' and 'name' attributes that the  
983 Printer object is returning in this response. The value in this response MUST be the same value  
984 as the "attributes-charset" operation attribute supplied by the client in the request. If this is not  
985 possible (i.e., the charset requested is not supported), the request would have been rejected. See  
986 "attributes-charset" described in Section 3.1.4.1 above.

987  
988 If the Printer object supports more than just the 'utf-8' charset, the Printer object MUST be able to  
989 code convert between each of the charsets supported on a highest fidelity possible basis in order  
990 to return the 'text' and 'name' attributes in the charset requested by the client. However, some  
991 information loss MAY occur during the charset conversion depending on the charsets involved.  
992 For example, the Printer object may convert from a UTF-8 'a' to a US-ASCII 'a' (with no loss of  
993 information), from an ISO Latin 1 CAPITAL LETTER A WITH ACUTE ACCENT to US-  
994 ASCII 'A' (losing the accent), or from a UTF-8 Japanese Kanji character to some ISO Latin 1  
995 error character indication such as '?', decimal code equivalent, or to the absence of a character,  
996 depending on implementation.

997  
998 Note: Whether an implementation that supports more than one charset stores the data in the  
999 charset supplied by the client or code converts to one of the other supported charsets, depends on  
1000 implementation. The strategy should try to minimize loss of information during code conversion.  
1001 On each response, such an implementation converts from its internal charset to that requested.

1002  
1003 "attributes-natural-language" (naturalLanguage):

1004 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
1005 the IPP object is returning in this response. Unlike the "attributes-charset" operation attribute,  
1006 the IPP object NEED NOT return the same value as that supplied by the client in the request.  
1007 The IPP object MAY return the natural language of the Job object or the Printer's configured  
1008 natural language as identified by the Printer object's "natural-language-configured" attribute,  
1009 rather than the natural language supplied by the client. For any 'text' or 'name' attribute or status  
1010 message in the response that is in a different natural language than the value returned in the  
1011 "attributes-natural-language" operation attribute, the IPP object MUST use the Natural Language  
1012 Override mechanism (see sections 4.1.1.2 and 4.1.2.2) on each attribute value returned. The IPP  
1013 object MAY use the Natural Language Override mechanism redundantly, i.e., use it even when  
1014 the value is in the same natural language as the value supplied in the "attributes-natural-  
1015 language" operation attribute of the response.

1016 3.1.5 Operation Targets

1017 All IPP operations are directed at IPP objects. For Printer operations, the operation is always directed at  
1018 a Printer object using one of its URIs (i.e., one of the values in the Printer object's "printer-uri-  
1019 supported" attribute). Even if the Printer object supports more than one URI, the client supplies only one  
1020 URI as the target of the operation. The client identifies the target object by supplying the correct URI in  
1021 the "printer-uri (uri)" operation attribute.

1022 For Job operations, the operation is directed at either:

- 1023 - The Job object itself using the Job object's URI. In this case, the client identifies the target object  
1024 by supplying the correct URI in the "job-uri (uri)" operation attribute.
- 1025 - The Printer object that created the Job object using both the Printer objects URI and the Job object's  
1026 Job ID. Since the Printer object that created the Job object generated the Job ID, it MUST be  
1027 able to correctly associate the client supplied Job ID with the correct Job object. The client  
1028 supplies the Printer object's URI in the "printer-uri (uri)" operation attribute and the Job object's  
1029 Job ID in the "job-id (integer(1:MAX))" operation attribute.

1030

1031 If the operation is directed at the Job object directly using the Job object's URI, the client MUST NOT  
1032 include the redundant "job-id" operation attribute.

1033 The operation target attributes are REQUIRED operation attributes that MUST be included in every  
1034 operation request. Like the charset and natural language attributes (see section 3.1.4), the operation  
1035 target attributes are specially ordered operation attributes. In all cases, the operation target attributes  
1036 immediately follow the "attributes-charset" and "attributes-natural-language" attributes within the  
1037 operation attribute group, however the specific ordering rules are:

- 1038 - In the case where there is only one operation target attribute (i.e., either only the "printer-uri"  
1039 attribute or only the "job-uri" attribute), that attribute MUST be the third attribute in the  
1040 operation attributes group.
- 1041 - In the case where Job operations use two operation target attributes (i.e., the "printer-uri" and "job-  
1042 id" attributes), the "printer-uri" attribute MUST be the third attribute and the "job-id" attribute  
1043 MUST be the fourth attribute.

1044

1045 In all cases, the target URIs contained within the body of IPP operation requests and responses must be  
1046 in absolute format rather than relative format (a relative URL identifies a resource with the scope of the  
1047 HTTP server, but does not include scheme, host or port).

1048 The following rules apply to the use of port numbers in URIs that identify IPP objects:

- 1049 1. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1050 number is specified within the URI, then that port number MUST be used by the client to contact  
1051 the IPP object.
- 1052
- 1053 2. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1054 number is not specified within the URI, then default port number implied by that URI scheme  
1055 MUST be used by the client to contact the IPP object.

1056  
1057 3. If the URI scheme does not allow an explicit port number to be specified within the URI, then the  
1058 default port number implied by that URI MUST be used by the client to contact the IPP object.  
1059

1060 Note: The IPP ~~encoding and transport~~ Encoding and Transport document [IPP-PRO] shows a mapping  
1061 of IPP onto HTTP/1.1 and defines a new default port number for using IPP over HTTP/1.1.

### 1062 3.1.6 Operation Status Codes and Messages

1063 Every operation response includes a REQUIRED "status-code" parameter and an OPTIONAL "status-  
1064 message" operation attribute. The "status-code" provides information on the processing of a request. A  
1065 "status-message" attribute provides a short textual description of the status of the operation. The status  
1066 code is intended for use by automata, and the status message is intended for the human end user. The  
1067 "status-message" is especially useful for a later version of a Printer object to return as supplemental  
1068 information for the human user to accompany a status code that an earlier version of a client might not  
1069 understand. If a response does include a "status-message" attribute, an IPP client NEED NOT examine  
1070 or display the message, however it SHOULD do so in some implementation specific manner.

1071 The "status-code" value is a numeric value that has semantic meaning. The "status-code" syntax is  
1072 similar to a "type2 enum" (see section 4.1 on "Attribute Syntaxes") except that values can range only  
1073 from 0x0000 to 0x7FFF. Section 13 describes the status codes, assigns the numeric values, and suggests  
1074 a corresponding status message for each status code. The "status-message" attribute's syntax is  
1075 "text(255)". A client implementation of IPP SHOULD convert status code values into any localized  
1076 message that has semantic meaning to the end user.

1077 If the Printer object supports the "status-message" operation attribute, the Printer object MUST be able  
1078 to generate this message in any of the natural languages identified by the Printer object's "generated-  
1079 natural-language-supported" attribute (see the "attributes-natural-language" operation attribute specified  
1080 in section 3.1.4.1). As described in section 3.1.4.1 for any returned 'text' attribute, if there is a choice for  
1081 generating this message, the Printer object uses the natural language indicated by the value of the  
1082 "attributes-natural-language" in the client request if supported, otherwise the Printer object uses the  
1083 value in the Printer object's own "natural-language-configured" attribute. If the Printer object supports  
1084 the "status-message" operation attribute, it SHOULD use the REQUIRED 'utf-8' charset to return a status  
1085 message for the following error status codes (see section 13): 'client-error-bad-request', 'client-error-  
1086 charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-supported', and 'server-  
1087 error-version-not-supported'. In this case, it MUST set the value of the "attributes-charset" operation  
1088 attribute to 'utf-8' in the error response.

1089 If the Printer performs an operation with no errors and it encounters no problems, it MUST return the  
1090 status code 'successful-ok' in the response. See section 13.

1091 If the client supplies unsupported values for the following parameters or Operation attributes, the Printer  
1092 object MUST reject the operation, NEED NOT return the unsupported attribute value in the  
1093 Unsupported Attributes group, and MUST return the indicated status code:

1094 <u>Parameter/Attribute</u>	<u>Status code</u>
---------------------------------	--------------------

<u>version-number</u>	<u>server-error-version-not-supported</u>
<u>operation-id</u>	<u>server-error-operation-not-supported</u>
<u>attributes-charset</u>	<u>client-error-charset-not-supported</u>
<u>compression</u>	<u>client-error-compression-not-supported</u>
<u>document-format</u>	<u>client-error-document-format-not-supported</u>
<u>document-uri</u>	<u>client-error-uri-scheme-not-supported, client-error-document-access-error</u>

1095  
1096  
1097  
  
1098  
  
1099  
1100  
1101  
1102  
1103  
1104  
1105  
1106  
1107  
1108  
1109  
1110  
1111  
1112  
1113  
1114  
1115  
1116  
1117  
1118  
1119  
1120  
1121  
1122  
1123  
1124  
1125  
1126  
1127  
1128  
1129  
1130  
1131

If the client supplies unsupported values for other attributes, or unsupported attributes, the Printer returns the status code defined in the next section on Unsupported Attributes.

### 3.1.7 Unsupported Attributes

The Unsupported Attributes group contains attributes that are not supported by the operation. This group is primarily for the job creation operations, but all operations can return this group.

A Printer object MUST include an Unsupported Attributes group in a response if the status code is one of the following: 'successful-ok-ignored-or-substituted-attributes', 'successful-ok-conflicting-attributes', 'client-error-attributes-or-values-not-supported' or 'client-error-conflicting-attributes'.

If the status code is one of the four specified in the preceding paragraph, the Unsupported Attributes group MUST contain all of those attributes and only those attributes that are:

- a) an Operation or Job Template attribute supplied in the request, and
- b) unsupported by the printer. See below for details on the three categories "unsupported" attributes. **Issue 18, Issue 23, and Issue 27**

If the Printer object is not returning any Unsupported Attributes in the response, the Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty group.

Unsupported attributes fall into three categories:

1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or value).
2. The Printer object does support the attribute, but does not support some or all of the particular attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those attribute syntaxes or values in its corresponding "xxx-supported" attribute).
3. The Printer object does support the attributes and values supplied, but the particular values are in conflict with one another, because they violate a constraint, such as not being able to staple transparencies.

In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute with a substituted value of 'unsupported'. This value's syntax type is "out-of-band" and its encoding is defined by special rules for "out-of-band" values in the "Encoding and Transport" specification [IPP-PRO]. Its value indicates no support for the attribute itself (see the beginning of section 4.1). **Issue 12**

1132 In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the Printer  
1133 object simply returns the client-supplied attribute with the unsupported attribute syntaxes or values as  
1134 supplied by the client. This indicates support for the attribute, but no support for that particular attribute  
1135 syntax or value. If the client supplies a multi-valued attribute with more than one value and the Printer  
1136 object supports the attribute but only supports a subset of the client-supplied attribute syntaxes or values,  
1137 the Printer object MUST return only those attribute syntaxes or values that are unsupported.

1138  
1139 In the case of two (or more) supported attribute values that are in conflict with one another (although  
1140 each is supported independently, the values conflict when requested together within the same job), the  
1141 Printer object MUST return all the values that it ignores or substitutes to resolve the conflict, but not any  
1142 of the values that it is still using. The choice for exactly how to resolve the conflict is implementation  
1143 dependent. See sections 3.2.1.2 and 15. See The Implementer's Guide [IPP-IIG] for an example.

### 1144 3.1.8 Versions

1145 Each operation request and response carries with it a "version-number" parameter. Each value of the  
1146 "version-number" is in the form "X.Y" where X is the major version number and Y is the minor version  
1147 number. By including a version number in the client request, it allows the client to identify which  
1148 version of IPP it is interested in using. If the IPP object does not support that version, the object  
1149 responds with a status code of 'server-error-version-not-supported' along with the closest version number  
1150 that is supported (see section 13.1.5.4).

1151 There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'  
1152 status code from an IPP object, there is nothing that prevents a client from trying again with a different  
1153 version number. In order to conform to ~~IPP/1.0, an implementation~~ IPP/1.1, an IPP object  
1154 implementations MUST support version '1.1' SHOULD at least support version '1.0'. **Issue 33**

1155 There is only one notion of "version number" that covers both IPP Model and IPP Protocol changes.  
1156 Thus the version number MUST change when introducing a new version of the Model and Semantics  
1157 document [IPP-MOD] or a new version of the ~~Encoding and Transport~~ "Encoding and Transport"  
1158 document [IPP-PRO].

1159 Changes to the major version number indicate structural or syntactic changes that make it impossible for  
1160 older version of IPP clients and Printer objects to correctly parse and correctly process the new or  
1161 changed attributes, operations and responses. If the major version number changes, the minor version  
1162 numbers is set to zero. As an example, adding the REQUIRED "ipp-attribute-fidelity" attribute to  
1163 version '1.1' (if it had not been part of version ~~'1.0'~~ '1.1'), would have required a change to the major  
1164 version number, since an IPP/1.0 Printer would not have processed a request with the correct semantics  
1165 that contained the "ipp-attribute-fidelity" attribute that it did ~~number~~ not know about. Items that might  
1166 affect the changing of the major version number include any changes to the Model and Semantics  
1167 document [IPP-MOD] or the ~~Encoding and Transport~~ [IPP- "Encoding and Transport" document [IPP-  
1168 PRO] itself, such as:

- 1169 - reordering of ordered attributes or attribute sets
- 1170 - changes to the syntax of existing attributes
- 1171 ~~-changing Operation or Job Template attributes from OPTIONAL to REQUIRED and vice versa~~
- 1172 ~~-adding REQUIRED (for an IPP object to support) operation attributes~~

- 1173 - adding REQUIRED (for an IPP object to support) operation attribute groups
- 1174 - adding values to existing REQUIRED operation attributes
- 1175 - adding REQUIRED operations
- 1176

1177 Changes to the minor version number indicate the addition of new features, attributes and attribute  
1178 values that may not be understood by all IPP objects, but which can be ignored if not understood. Items  
1179 that might affect the changing of the minor version number include any changes to the model objects and  
1180 attributes but not the encoding and transport rules [IPP-PRO] (except adding attribute syntaxes).  
1181 Examples of such changes are:

- 1182 - grouping all extensions not included in a previous version into a new version
- 1183 - adding new attribute values
- 1184 - adding new object attributes
- 1185 - adding OPTIONAL (for an IPP object to support) operation attributes (i.e., those attributes that an  
1186 IPP object can ignore without confusing clients)
- 1187 - adding OPTIONAL (for an IPP object to support) operation attribute groups (i.e., those attributes  
1188 that an IPP object can ignore without confusing clients)
- 1189 - adding new attribute syntaxes
- 1190 - adding OPTIONAL operations
- 1191 - changing Job Description attributes or Printer Description attributes from OPTIONAL to  
1192 REQUIRED or vice versa.
- 1193 - adding OPTIONAL attribute syntaxes to an existing attribute. Issue 33

1194 The encoding of the ~~"operation-id", the "version-number", the "status-code", and the "request-id"~~ MUST  
1195 NOT change over any version number (either major or minor). This rule guarantees that all future  
1196 versions will be backwards compatible with all previous versions (at least for checking the ~~"operation-~~  
1197 ~~id", the "version-number", and the "request-id"~~). In addition, any protocol elements (attributes, error  
1198 codes, tags, etc.) that are not carried forward from one version to the next are deprecated so that they can  
1199 never be reused with new semantics.

1200 Implementations that support a certain ~~major~~ version NEED NOT support ALL previous versions. As  
1201 each new ~~major~~ version is defined (through the release of a new specification), that major version will  
1202 specify which previous ~~major~~ versions MUST and which versions SHOULD be supported in compliant  
1203 implementations. Issue 33

### 1204 3.1.9 Job Creation Operations

1205 In order to "submit a print job" and create a new Job object, a client issues a create request. A create  
1206 request is any one of following three operation requests:

- 1207 - The Print-Job Request: A client that wants to submit a print job with only a single document uses  
1208 the Print-Job operation. The operation allows for the client to "push" the document data to the  
1209 Printer object by including the document data in the request itself.
- 1210
- 1211 - The Print-URI Request: A client that wants to submit a print job with only a single document  
1212 (where the Printer object "pulls" the document data instead of the client "pushing" the data to the

1213 Printer object) uses the Print-URI operation. In this case, the client includes in the request only a  
1214 URI reference to the document data (not the document data itself).

1215  
1216 - The Create-Job Request: A client that wants to submit a print job with multiple documents uses the  
1217 Create-Job operation. This operation is followed by an arbitrary number of Send-Document  
1218 and/or Send-URI operations (each creating another document for the newly create Job object).  
1219 The Send-Document operation includes the document data in the request (the client "pushes" the  
1220 document data to the printer), and the Send-URI operation includes only a URI reference to the  
1221 document data in the request (the Printer "pulls" the document data from the referenced location).  
1222 The last Send-Document or Send-URI request for a given Job object includes a "last-document"  
1223 operation attribute set to 'true' indicating that this is the last request.  
1224

1225 Throughout this model specification, the term "create request" is used to refer to any of these three  
1226 operation requests.

1227 A Create-Job operation followed by only one Send-Document operation is semantically equivalent to a  
1228 Print-Job operation, however, for performance reasons, the client SHOULD use the Print-Job operation  
1229 for all single document jobs. Also, Print-Job is a REQUIRED operation (all implementations MUST  
1230 support it) whereas Create-Job is an OPTIONAL operation, hence some implementations might not  
1231 support it.

1232 Job submission time is the point in time when a client issues a create request. The initial state of every  
1233 Job object is the 'pending', ~~or~~ 'pending-held', or 'processing' state (see section 4.3.7). **Issue 13** When the  
1234 Printer object begins processing the print job. ~~At this point in time~~, the Job object's state moves to  
1235 'processing'. This is known as job processing time. There are validation checks that must be done at job  
1236 submission time and others that must be performed at job processing time.

1237 At job submission time and at the time a Validate-Job operation is received, the Printer MUST do the  
1238 following:

- 1239 1. Process the client supplied attributes and either accept or reject the request
- 1240 2. Validate the syntax of and support for the scheme of any client supplied URI

1241

1242 At job submission time the Printer object MUST validate whether or not the supplied attributes, attribute  
1243 syntaxes, and values are supported by matching them with the Printer object's corresponding "xxx-  
1244 supported" attributes. See section 3.1.7 for details. [IPP-IIG] presents suggested steps for an IPP object  
1245 to either accept or reject any request and additional steps for processing create requests.

1246 At job submission time the Printer object NEED NOT perform the validation checks reserved for job  
1247 processing time such as:

- 1248 1. Validating the document data
- 1249 2. Validating the actual contents of any client supplied URI (resolve the reference and follow the link  
1250 to the document data)

1251

1252 At job submission time, these additional job processing time validation checks are essentially useless,  
1253 since they require actually parsing and interpreting the document data, are not guaranteed to be 100%  
1254 accurate, and MUST be done, yet again, at job processing time. Also, in the case of a URI, checking for  
1255 availability at job submission time does not guarantee availability at job processing time. In addition, at  
1256 job processing time, the Printer object might discover any of the following conditions that were not  
1257 detectable at job submission time:

- 1258 - runtime errors in the document data,
  - 1259 - nested document data that is in an unsupported format,
  - 1260 - the URI reference is no longer valid (i.e., the server hosting the document might be down), or
  - 1261 - any other job processing error
- 1262

1263 At job submission time, a Printer object, especially a non-spooling Printer, MAY accept jobs that it does  
1264 not have enough space for. In such a situation, a Printer object MAY stop reading data from a client for  
1265 an indefinite period of time. A client MUST be prepared for a write operation to block for an indefinite  
1266 period of time (See section 5.1 on client conformance).

1267 When a Printer object has too little space for starting a new job, it MAY reject a new create request. In  
1268 this case, a Printer object MUST return a response (in reply to the rejected request) with a status-code of  
1269 'server-error-busy' (See section 14.1.5.8) and it MAY close the connection before receiving all bytes of  
1270 the operation. When receiving a 'server-error-busy' status-code in an operation response, a client MUST  
1271 be prepared for the Printer object to close the connection before the client has sent all of the data  
1272 (especially for the Print-Job operation). A client MUST be prepared to keep submitting a create request  
1273 until the IPP Printer object accepts the create request. Issue 20

1274 At job processing time, since the Printer object has already responded with a successful status code in  
1275 the response to the create request, if the Printer object detects an error, the Printer object is unable to  
1276 inform the end user of the error with an operation status code. In this case, the Printer, depending on the  
1277 error, can set the job object's "job-state", "job-state-reasons", or "job-state-message" attributes to the  
1278 appropriate value(s) so that later queries can report the correct job status.

1279 Note: Asynchronous notification of events is outside the scope of ~~IPP/1.0~~ this IPP/1.1 document.

1280

## 1281 3.2 Printer Operations

1282 All Printer operations are directed at Printer objects. A client MUST always supply the "printer-uri"  
1283 operation attribute in order to identify the correct target of the operation.

### 1284 3.2.1 Print-Job Operation

1285 This REQUIRED operation allows a client to submit a print job with only one document and supply the  
1286 document data (rather than just a reference to the data). See Section 15 for the suggested steps for  
1287 processing create operations and their Operation and Job Template attributes.

1288 3.2.1.1 Print-Job Request

1289 The following groups of attributes are supplied as part of the Print-Job Request:

1290 Group 1: Operation Attributes

1291 Natural Language and Character Set:

1292 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1293 3.1.4.1. The Printer object MUST copy these values to the corresponding Job Description  
1294 attributes described in sections 0 and 4.3.18.

1295  
1296 Target:

1297 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1298 section 3.1.5.

1299  
1300 Requesting User Name:

1301 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1302 described in section 8.3.

1303  
1304 "job-name" (name(MAX)):

1305 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1306 attribute. It contains the client supplied Job name. If this attribute is supplied by the client, its  
1307 value is used for the "job-name" attribute of the newly created Job object. The client MAY  
1308 automatically include any information that will help the end-user distinguish amongst his/her  
1309 jobs, such as the name of the application program along with information from the document,  
1310 such as the document name, document subject, or source file name. If this attribute is not  
1311 supplied by the client, the Printer generates a name to use in the "job-name" attribute of the  
1312 newly created Job object (see Section 4.3.5).

1313  
1314 "ipp-attribute-fidelity" (boolean):

1315 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1316 attribute. The value 'true' indicates that total fidelity to client supplied Job Template attributes  
1317 and values is required, else the Printer object MUST reject the Print-Job request. The value  
1318 'false' indicates that a reasonable attempt to print the Job object is acceptable and the Printer  
1319 object MUST accept the Print-job request. If not supplied, the Printer object assumes the value is  
1320 'false'. All Printer objects MUST support both types of job processing. See section 15 for a full  
1321 description of "ipp-attribute-fidelity" and its relationship to other attributes, especially the Printer  
1322 object's "pdl-override-supported" attribute.

1323  
1324 "document-name" (name(MAX)):

1325 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1326 attribute. It contains the client supplied document name. The document name MAY be  
1327 different than the Job name. Typically, the client software automatically supplies the document  
1328 name on behalf of the end user by using a file name or an application generated name. If this  
1329 attribute is supplied, its value can be used in a manner defined by each implementation.  
1330 Examples include: printed along with the Job (job start sheet, page adornments, etc.), used by

1331 accounting or resource tracking management tools, or even stored along with the document as a  
1332 document level attribute. ~~IPP/1.0~~IPP/1.1 does not support the concept of document level  
1333 attributes.

1334  
1335 "compression" (type3 keyword)

1336 The client OPTIONALLY supplies this attribute. The Printer object ~~OPTIONALLY~~  
1337 ~~supports~~MUST support this attribute and the "compression-supported" attribute (see section  
1338 4.4.32). The client supplied "compression" operation attribute identifies the compression  
1339 algorithm used on the document data. The following cases exist:

- 1340 a) If the client omits this attribute, the Printer object MUST assume that the data is not  
1341 compressed- (i.e. the Printer follows the rules below as if the client supplied the  
1342 "compression" attribute with a value of 'none').
- 1343 b) ~~If the client supplies the attribute and the Printer object supports the attribute, the~~  
1344 ~~Printer object uses the corresponding decompression algorithm on the document data.~~  
1345 If the client supplies this attribute, but the value is not supported by the Printer object,  
1346 i.e., the value is not one of the values of the Printer object's "compression-supported"  
1347 attribute, the Printer object MUST ~~copy the attribute and its value to the Unsupported~~  
1348 ~~Attributes response group,~~ reject the request, and return the ~~'client-error-attributes-or-~~  
1349 ~~values-not-supported' status code.~~'client-error-compression-not-supported' status code.  
1350 See section 3.1.7 for returning unsupported attributes and values.
- 1351 c) If the client supplies the attribute and the Printer object supports the attribute value,  
1352 the Printer object uses the corresponding decompression algorithm on the document  
1353 data.
- 1354 d) If the decompression algorithm fails before the Printer returns an operation response,  
1355 the Printer object MUST reject the request and return the 'client-error-compression-  
1356 error' status code.
- 1357 e) If the decompression algorithm fails after the Printer returns an operation response,  
1358 the Printer object MUST abort the job and add the 'compression-error' value to the  
1359 job's "job-state-reasons" attribute.
- 1360 f) If the decompression algorithm succeeds, the document data MUST then have the  
1361 format specified by the job's "document-format" attribute (q.v.). **Issue 28**

1362  
1363 "document-format" (mimeMediaType) :

1364 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1365 attribute. The value of this attribute identifies the format of the supplied document data. The  
1366 following cases exist:

- 1367 a) If the client does not supply this attribute, the Printer object assumes that the  
1368 document data is in the format defined by the Printer object's "document-format-  
1369 default" attribute. (i.e. the Printer follows the rules below as if the client supplied the  
1370 "document-format" attribute with a value equal to the printer's default value).
- 1371 b) If the client supplies this attribute, but the value is not supported by the Printer object,  
1372 i.e., the value is not one of the values of the Printer object's "document-format-  
1373 supported" attribute, the Printer object MUST reject the request and return the 'client-  
1374 error-document-format-not-supported' status code.

- 1375 c) If the client supplies this attribute and its value is 'application/octet-stream' (i.e. to be  
1376 auto-sensed, see Section 4.1.9.1), and the format is not one of the document-formats  
1377 that the Printer can auto-sense, and this check occurs before the Printer returns an  
1378 operation response, then the Printer MUST reject the request and return the 'client-  
1379 error-document-format-not-supported' status code.  
1380 d) If the client supplies this attribute, and the value is supported by the Printer object, the  
1381 document data, the Printer is capable of interpreting the document data.  
1382 e) If interpreting of the document data fails before the Printer returns an operation  
1383 response, the Printer object MUST reject the request and return the 'client-error-  
1384 document-format-error' status code.  
1385 f) If interpreting of the document data fails after the Printer returns an operation  
1386 response, the Printer object MUST abort the job and add the 'document-format-error'  
1387 value to the job's "job-state-reasons" attribute. Issue 11  
1388

1389 "document-natural-language" (naturalLanguage):

1390 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
1391 this attribute. This attribute specifies the natural language of the document for those document-  
1392 formats that require a specification of the natural language in order to image the document  
1393 unambiguously. There are no particular values required for the Printer object to support.  
1394

1395  
1396 "job-k-octets" (integer(0:MAX))

1397 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
1398 this attribute and the "job-k-octets-supported" attribute (see section 4.4.33). The client supplied  
1399 "job-k-octets" operation attribute identifies the total size of the document(s) in K octets being  
1400 submitted (see section 4.3.15.1 for the complete semantics). If the client supplies the attribute  
1401 and the Printer object supports the attribute, the value of the attribute is used to populate the Job  
1402 object's "job-k-octets" Job Description attribute.  
1403

1404 Note: For this attribute and the following two attributes ("job-impressions", and "job-media-  
1405 sheets"), if the client supplies the attribute, but the Printer object does not support the attribute,  
1406 the Printer object ignores the client-supplied value. If the client supplies the attribute and the  
1407 Printer supports the attribute, and the value is within the range of the corresponding Printer  
1408 object's "xxx-supported" attribute, the Printer object MUST use the value to populate the Job  
1409 object's "xxx" attribute. If the client supplies the attribute and the Printer supports the attribute,  
1410 but the value is outside the range of the corresponding Printer object's "xxx-supported" attribute,  
1411 the Printer object MUST copy the attribute and its value to the Unsupported Attributes response  
1412 group, reject the request, and return the 'client-error-attributes-or-values-not-supported' status  
1413 code. If the client does not supply the attribute, the Printer object MAY choose to populate the  
1414 corresponding Job object attribute depending on whether the Printer object supports the attribute  
1415 and is able to calculate or discern the correct value.  
1416

1417 "job-impressions" (integer(0:MAX))

1418 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
1419 this attribute and the "job-impressions-supported" attribute (see section 4.4.34). The client

1420 supplied "job-impressions" operation attribute identifies the total size in number of impressions  
1421 of the document(s) being submitted (see section 4.3.15.2 for the complete semantics).

1422  
1423 See note under "job-k-octets".

1424  
1425 "job-media-sheets" (integer(0:MAX))  
1426 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
1427 this attribute and the "job-media-sheets-supported" attribute (see section 4.4.35). The client  
1428 supplied "job-media-sheets" operation attribute identifies the total number of media sheets to be  
1429 produced for this job (see section 4.3.15.3 for the complete semantics).

1430  
1431 See note under "job-k-octets".

1432  
1433 Group 2: Job Template Attributes

1434 The client OPTIONALLY supplies a set of Job Template attributes as defined in section 4.2. If  
1435 the client is not supplying any Job Template attributes in the request, the client SHOULD omit  
1436 Group 2 rather than sending an empty group. However, a Printer object MUST be able to accept  
1437 an empty group.

1438  
1439 Group 3: Document Content

1440 The client MUST supply the document data to be processed.  
1441

1442 Note: In addition to the MANDATORY parameters required for every operation request, the simplest  
1443 Print-Job Request consists of just the "attributes-charset" and "attributes-natural-language" operation  
1444 attributes; the "printer-uri" target operation attribute; the Document Content and nothing else. In this  
1445 simple case, the Printer object:

- 1446 - creates a new Job object (the Job object contains a single document),
- 1447 - stores a generated Job name in the "job-name" attribute in the natural language and charset  
1448 requested (see Section 3.1.4.1) (if those are supported, otherwise using the Printer object's default  
1449 natural language and charset), and
- 1450 - at job processing time, uses its corresponding default value attributes for the supported Job  
1451 Template attributes that were not supplied by the client as IPP attribute or embedded instructions  
1452 in the document data.

1453  
  
1454 3.2.1.2 Print-Job Response

1455 The Printer object MUST return to the client the following sets of attributes as part of the Print-Job  
1456 Response:

1457 Group 1: Operation Attributes

1458 Status Message:

1459 In addition to the REQUIRED status code returned in every response, the response  
1460 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
1461 and 3.1.6. If the client supplies unsupported or conflicting Job Template attributes or values, the  
1462 Printer object MUST reject or accept the Print-Job request depending on the whether the client  
1463 supplied a 'true' or 'false' value for the "ipp-attribute-fidelity" operation attribute. See the  
1464 Implementer's Guide [IPP-IIG] for a complete description of the suggested steps for processing a  
1465 create request.

1466  
1467 Natural Language and Character Set:

1468 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1469 3.1.4.2.

1470

1471 Group 2: Unsupported Attributes

1472 ~~This is a set of Operation and Job Template attributes supplied by the client (in the request) that~~  
1473 ~~are not supported by the Printer object or that conflict with one another (see the Implementer's~~  
1474 ~~Guide [IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the~~  
1475 ~~response, the Printer object SHOULD omit Group 2 rather than sending an empty group.~~  
1476 ~~However, a client MUST be able to accept an empty group.~~

1477

1478 ~~Unsupported attributes fall into three categories:~~

1479

- 1480 ~~1. The Printer object does not support the supplied attribute (no matter what the attribute syntax~~  
1481 ~~or value).~~
- 1482 ~~2. The Printer object does support the attribute, but does not support some or all of the particular~~  
1483 ~~attribute syntaxes or values supplied by the client (i.e., the Printer object does not have~~  
1484 ~~those attribute syntaxes or values in its corresponding "xxx-supported" attribute).~~
- 1485 ~~3. The Printer object does support the attributes and values supplied, but the particular values are~~  
1486 ~~in conflict with one another, because they violate a constraint, such as not being able to~~  
1487 ~~staple transparencies.~~

1488

1489 ~~In the case of an unsupported attribute name, the Printer object returns the client-supplied~~  
1490 ~~attribute with a substituted "out-of-band" value of 'unsupported' indicating no support for the~~  
1491 ~~attribute itself (see the beginning of section 4.1).~~

1492

1493 ~~In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the~~  
1494 ~~Printer object simply returns the client-supplied attribute with the unsupported attribute syntaxes~~  
1495 ~~or values as supplied by the client. This indicates support for the attribute, but no support for that~~  
1496 ~~particular attribute syntax or value. If the client supplies a multi-valued attribute with more than~~  
1497 ~~one value and the Printer object supports the attribute but only supports a subset of the client-~~  
1498 ~~supplied attribute syntaxes or values, the Printer object MUST return only those attribute~~  
1499 ~~syntaxes or values that are unsupported.~~

1500

1501 ~~In the case of two (or more) supported attribute values that are in conflict with one another~~  
1502 ~~(although each is supported independently, the values conflict when requested together within the~~  
1503 ~~same job), the Printer object MUST return all the values that it ignores or substitutes to resolve~~  
1504 ~~the conflict, but not any of the values that it is still using. The choice for exactly how to resolve~~  
1505 ~~the conflict is implementation dependent. See The Implementer's Guide [IPP-IG] for an~~  
1506 ~~example.~~

1507  
1508

1509 See section 3.1.7 for details on returning Unsupported Attributes.

1510

1511 ~~In these three cases, the~~The value of the "ipp-attribute-fidelity" supplied by the client does not  
1512 affect what attributes the Printer object returns in this group. The value of "ipp-attribute-fidelity"  
1513 only affects whether the Print-Job operation is accepted or rejected. If the job is accepted, the  
1514 client may query the job using the Get-Job-Attributes operation requesting the unsupported  
1515 attributes that were returned in the create response to see which attributes were ignored (not  
1516 stored on the Job object) and which attributes were stored with other (substituted) values.

1517

### 1518 Group 3: Job Object Attributes

1519 "job-uri" (uri):

1520 The Printer object MUST return the Job object's URI by returning the contents of the  
1521 REQUIRED "job-uri" Job object attribute. The client uses the Job object's URI when directing  
1522 operations at the Job object. The Printer object always uses its configured security policy when  
1523 creating the new URI. However, if the Printer object supports more than one URI, the Printer  
1524 object also uses information about which URI was used in the Print-Job Request to generated the  
1525 new URI so that the new URI references the correct access channel. In other words, if the Print-  
1526 Job Request comes in over a secure channel, the Printer object MUST generate a Job URI that  
1527 uses the secure channel as well.

1528

1529 "job-id" (integer(1:MAX)):

1530 The Printer object MUST return the Job object's Job ID by returning the REQUIRED "job-id"  
1531 Job object attribute. The client uses this "job-id" attribute in conjunction with the "printer-uri"  
1532 attribute used in the Print-Job Request when directing Job operations at the Printer object.

1533

1534 "job-state":

1535 The Printer object MUST return the Job object's REQUIRED "job-state" attribute. The value of  
1536 this attribute (along with the value of the next attribute: "job-state-reasons") is taken from a  
1537 "snapshot" of the new Job object at some meaningful point in time (implementation defined)  
1538 between when the Printer object receives the Print-Job Request and when the Printer object  
1539 returns the response.

1540

1541 "job-state-reasons":

1542 The Printer object ~~OPTIONALLY returns~~**MUST return** the Job object's ~~OPTIONAL "job-state-~~  
1543 ~~reasons" attribute. If the Printer object supports this attribute then it MUST be returned in the~~  
1544 ~~response. If this attribute is not returned in the response, the client can assume that the "job-~~

1545 ~~state-reasons" attribute is not supported and will not~~ REQUIRED "job-state-reasons" attribute. .  
1546 **Issue 30**  
1547 ~~be returned in a subsequent Job object query.~~

1548  
1549 "job-state-message":

1550 The Printer object OPTIONALLY returns the Job object's OPTIONAL "job-state-message"  
1551 attribute. If the Printer object supports this attribute then it MUST be returned in the response. If  
1552 this attribute is not returned in the response, the client can assume that the "job-state-message"  
1553 attribute is not supported and will not be returned in a subsequent Job object query.

1554  
1555 "number-of-intervening-jobs":

1556 The Printer object OPTIONALLY returns the Job object's OPTIONAL "number-of-intervening-  
1557 jobs" attribute. If the Printer object supports this attribute then it MUST be returned in the  
1558 response. If this attribute is not returned in the response, the client can assume that the "number-  
1559 of-intervening-jobs" attribute is not supported and will not be returned in a subsequent Job object  
1560 query.

1561  
1562 Note: Since any printer state information which affects a job's state is reflected in the "job-state"  
1563 and "job-state-reasons" attributes, it is sufficient to return only these attributes and no specific  
1564 printer status attributes.

1565  
1566 Note: In addition to the MANDATORY parameters required for every operation response, the simplest  
1567 response consists of the just the "attributes-charset" and "attributes-natural-language" operation  
1568 attributes and the "job-uri", "job-id", and "job-state" Job Object Attributes. In this simplest case, the  
1569 status code is ~~"successful-ok"~~ "successful-ok" and there is no "status-message" operation attribute.

### 1570 3.2.2 Print-URI Operation

1571 This OPTIONAL operation is identical to the Print-Job operation (section 3.2.1) except that a client  
1572 supplies a URI reference to the document data using the "document-uri" (uri) operation attribute (in  
1573 Group 1) rather than including the document data itself. Before returning the response, the Printer  
1574 MUST validate that the Printer supports the retrieval method (e.g., http, ftp, etc.) implied by the URI,  
1575 and MUST check for valid URI syntax. If the client-supplied URI scheme is not supported, i.e. the value  
1576 is not in the Printer object's "referenced-uri-scheme-supported" attribute, the Printer object MUST reject  
1577 the request and return the 'client-error-uri-scheme-not-supported' status code.

1578 The IPP Printer MAY validate the accessibility of the document as part of the operation or subsequently.  
1579 If the Printer determines an accessibility problem before returning an operation response, it rejects the  
1580 request and returns the 'client-error-document-access-error' status code. If the Printer determines this  
1581 accessibility problem after accepting the request and returning an operation response with one of the  
1582 successful status codes, the Printer adds the 'document-access-error' value to the job's "job-state-reasons"  
1583 attribute. See The Implementer's Guide [IPP-IIG] for suggested additional checks. ~~The Printer NEED~~  
1584 ~~NOT follow the reference and validate the contents of the reference.~~ **Issue 35**

1585 If the Printer object supports this operation, it MUST support the "reference-uri-schemes-supported"  
1586 Printer attribute (see section 4.4.27).

1587 It is up to the IPP object to interpret the URI and subsequently "pull" the document from the source  
1588 referenced by the URI string.

### 1589 3.2.3 Validate-Job Operation

1590 This REQUIRED operation is similar to the Print-Job operation (section 3.2.1) except that a client  
1591 supplies no document data and the Printer allocates no resources (i.e., it does not create a new Job  
1592 object). This operation is used only to verify capabilities of a printer object against whatever attributes  
1593 are supplied by the client in the Validate-Job request. By using the Validate-Job operation a client can  
1594 validate that an identical Print-Job operation (with the document data) would be accepted. The Validate-  
1595 Job operation also performs the same security negotiation as the Print-Job operation (see section 8), so  
1596 that a client can check that the client and Printer object security requirements can be met before  
1597 performing a Print-Job operation.

1598 Note: The Validate-Job operation does not accept a "document-uri" attribute in order to allow a client to  
1599 check that the same Print-URI operation will be accepted, since the client doesn't send the data with the  
1600 Print-URI operation. The client SHOULD just issue the Print-URI request.

1601 The Printer object returns the same status codes, Operation Attributes (Group 1) and Unsupported  
1602 Attributes (Group 2) as the Print-Job operation. However, no Job Object Attributes (Group 3) are  
1603 returned, since no Job object is created.

### 1604 3.2.4 Create-Job Operation

1605 This OPTIONAL operation is similar to the Print-Job operation (section 3.2.1) except that in the Create-  
1606 Job request, a client does not supply document data or any reference to document data. Also, the client  
1607 does not supply any of the "document-name", "document-format", "compression", or "document-natural-  
1608 language" operation attributes. This operation is followed by one or more Send-Document or Send-URI  
1609 operations. In each of those operation requests, the client OPTIONALLY supplies the "document-  
1610 name", "document-format", and "document-natural-language" attributes for each document in the multi-  
1611 document Job object.

1612 If a Printer object supports the Create-Job operation, it MUST also support the Send-Document  
1613 operation and also MAY support the Send-URI operation.

1614 If the Printer object supports this operation, it MUST support the "multiple-operation-time-out" Printer  
1615 attribute (see section 4.4.31).

1616 ~~In addition to the Print-Job status codes in the following additional error status codes not applicable to~~  
1617 ~~Print-Job MAY be returned:~~

1618 If the Printer object supports this operation, then it MUST support the "multiple-document-jobs-  
1619 supported" Printer Description attribute and indicate whether or not it supports multiple-document jobs.  
1620 Issue 34

1621 If the Printer object supports this operation and supports multiple documents in a job, then it MUST  
1622 support the "multiple-document-handling" Job Template job attribute with at least one value (see section  
1623 4.2.4) and the associated "multiple-document-handling-default" and "multiple-document-handling-  
1624 supported" Job Template Printer attributes. Issue 34

1625 After the Create-Job operation has completed, the value of the "job-state" attribute is similar to the "job-  
1626 state" after a Print-Job, even though no document-data has arrived. A Printer MAY set the 'job-data-  
1627 insufficient' value of the job's "job-state-reason" attribute to indicate that processing cannot begin until  
1628 sufficient data has arrived and set the "job-state" to either 'pending' or 'pending-held'. A non-spooling  
1629 printer that doesn't implement the 'pending' job state may even set the "job-state" to 'processing', even  
1630 though there is not yet any data to process. Issue 13

### 1631 3.2.5 Get-Printer-Attributes Operation

1632 This REQUIRED operation allows a client to request the values of the attributes of a Printer object. In  
1633 the request, the client supplies the set of Printer attribute names and/or attribute group names in which  
1634 the requester is interested. In the response, the Printer object returns a corresponding attribute set with  
1635 the appropriate attribute values filled in.

1636 For Printer objects, the possible names of attribute groups are:

- 1637 - 'job-template': ~~all~~ the subset of the Job Template attributes that apply to a Printer object (the last two  
1638 columns of the table in Section 4.2) that the implementation supports for Printer objects.
- 1639 - 'printer-description': the subset of the attributes specified in Section 4.4 that the implementation  
1640 supports for Printer objects.
- 1641 - 'all': the special group 'all' that includes all ~~supported attributes.~~ attributes that the implementation  
1642 supports for Printer objects. Issue 23

1644 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
1645 overlap. For example, if a client requests, 'printer-name' and 'all', the client is actually requesting the  
1646 "printer-name" attribute twice: once by naming it explicitly, and once by inclusion in the 'all' group. In  
1647 such cases, the Printer object NEED NOT return each attribute only once in the response even if it is  
1648 requested multiple times. The client SHOULD NOT request the same attribute in multiple ways.

1649 It is NOT REQUIRED that a Printer object support all attributes belonging to a group (since some  
1650 attributes are OPTIONAL). However, it is REQUIRED that each Printer object support all group names.

#### 1651 3.2.5.1 Get-Printer-Attributes Request

1652 The following sets of attributes are part of the Get-Printer-Attributes Request:

1653 Group 1: Operation Attributes

1654 Natural Language and Character Set:  
1655 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1656 3.1.4.1.

1657  
1658 Target:  
1659 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1660 section 3.1.5.

1661  
1662 Requesting User Name:  
1663 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1664 described in section 8.3.

1665  
1666 "requested-attributes" (1setOf keyword) :  
1667 The client OPTIONALLY supplies a set of attribute names and/or attribute group names in  
1668 whose values the requester is interested. The Printer object MUST support this attribute. If the  
1669 client omits this attribute, the Printer MUST respond as if this attribute had been supplied with a  
1670 value of 'all'.

1671  
1672 "document-format" (mimeMediaType) :  
1673 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1674 attribute. This attribute is useful for a Printer object to determine the set of supported attribute  
1675 values that relate to the requested document format. The Printer object MUST return the  
1676 attributes and values that it uses to validate a job on a create or Validate-Job operation in which  
1677 this document format is supplied. The Printer object SHOULD return only (1) those attributes  
1678 that are supported for the specified format and (2) the attribute values that are supported for the  
1679 specified document format. By specifying the document format, the client can get the Printer  
1680 object to eliminate the attributes and values that are not supported for a specific document  
1681 format. For example, a Printer object might have multiple interpreters to support both  
1682 'application/postscript' (for PostScript) and 'text/plain' (for text) documents. However, for only  
1683 one of those interpreters might the Printer object be able to support "number-up" with values of  
1684 '1', '2', and '4'. For the other interpreter it might be able to only support "number-up" with a value  
1685 of '1'. Thus a client can use the Get-Printer-Attributes operation to obtain the attributes and  
1686 values that will be used to accept/reject a create job operation.

1687  
1688 If the Printer object does not distinguish between different sets of supported values for each  
1689 different document format when validating jobs in the create and Validate-Job operations, it  
1690 MUST NOT distinguish between different document formats in the Get-Printer-Attributes  
1691 operation. If the Printer object does distinguish between different sets of supported values for  
1692 each different document format specified by the client, this specialization applies only to the  
1693 following Printer object attributes:

- 1694  
1695 - Printer attributes that are Job Template attributes ("xxx-default" "xxx-supported", and "xxx-  
1696 ready" in the Table in Section 4.2),  
1697 - "pdl-override-supported",  
1698 - "compression-supported",

- 1699 - "job-k-octets-supported",
- 1700 - "job-impressions-supported",
- 1701 - "job-media-sheets-supported"
- 1702 - "printer-driver-installer",
- 1703 - "color-supported", and
- 1704 - "reference-uri-schemes-supported"

1705  
1706 The values of all other Printer object attributes (including "document-format-supported") remain  
1707 invariant with respect to the client supplied document format (except for new Printer description  
1708 attribute as registered according to section 6.2).

1709  
1710 If the client omits this "document-format" operation attribute, the Printer object MUST respond  
1711 as if the attribute had been supplied with the value of the Printer object's "document-format-  
1712 default" attribute. It is recommended that the client always supply a value for "document-  
1713 format", since the Printer object's "document-format-default" may be 'application/octet-stream',  
1714 in which case the returned attributes and values are for the union of the document formats that  
1715 the Printer can automatically sense. For more details, see the description of the  
1716 'mimeType' attribute syntax in section 4.1.9.

1717  
1718 If the client supplies a value for the "document-format" Operation attribute that is not supported  
1719 by the Printer, i.e., is not among the values of the Printer object's "document-format-supported"  
1720 attribute, the Printer object MUST reject the operation and return the 'client-error-document-  
1721 format-not-supported' status code.

1722

### 1723 3.2.5.2 Get-Printer-Attributes Response

1724 The Printer object returns the following sets of attributes as part of the Get-Printer-Attributes Response:

#### 1725 Group 1: Operation Attributes

##### 1726 Status Message:

1727 In addition to the REQUIRED status code returned in every response, the response  
1728 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
1729 and 3.1.6.

1730

##### 1731 Natural Language and Character Set:

1732 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1733 3.1.4.2.

1734

#### 1735 Group 2: Unsupported Attributes

1736 See section 3.1.7 for details on returning Unsupported Attributes.

1737

1738 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported~~  
1739 ~~by the Printer object or that conflict with one another (see sections 3.2.1.2 and 16).~~ The response

1740           NEED NOT contain the "requested-attributes" operation attribute with any supplied values  
1741           (attribute keywords) that were requested by the client but are not supported by the IPP object. If  
1742           the Printer ~~object is not returning any Unsupported Attributes in the response, the Printer object~~  
1743           ~~SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able~~  
1744           ~~to accept an empty group.~~  
1745           does include unsupported attributes referenced in "requested-attributes" and such attributes  
1746           include group names, such as 'all', the unsupported attributes MUST NOT include attributes  
1747           described in the standard but not supported by the implementation. Issue 23  
1748

1749   Group 3: Printer Object Attributes

1750           This is the set of requested attributes and their current values. The Printer object ignores (does  
1751           not respond with) any requested attribute which is not supported. The Printer object MAY  
1752           respond with a subset of the supported attributes and values, depending on the security policy in  
1753           force. However, the Printer object MUST respond with the 'unknown' value for any supported  
1754           attribute (including all REQUIRED attributes) for which the Printer object does not know the  
1755           value. Also the Printer object MUST respond with the 'no-value' for any supported attribute  
1756           (including all REQUIRED attributes) for which the system administrator has not configured a  
1757           value. See the description of the "out-of-band" values in the beginning of Section 4.1.  
1758

1759   3.2.6 Get-Jobs Operation

1760           This REQUIRED operation allows a client to retrieve the list of Job objects belonging to the target  
1761           Printer object. The client may also supply a list of Job attribute names and/or attribute group names. A  
1762           group of Job object attributes will be returned for each Job object that is returned.

1763           This operation is similar to the Get-Job-Attributes operation, except that this Get-Jobs operation returns  
1764           attributes from possibly more than one object (see the description of Job attribute group names in section  
1765           3.3.4).

1766   3.2.6.1 Get-Jobs Request

1767           The client submits the Get-Jobs request to a Printer object.

1768           The following groups of attributes are part of the Get-Jobs Request:

1769   Group 1: Operation Attributes

1770           Natural Language and Character Set:

1771           The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1772           3.1.4.1.

1773           Target:

1774           The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1775           section 3.1.5.  
1776  
1777

1778 Requesting User Name:  
1779 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1780 described in section 8.3.

1781  
1782 "limit" (integer(1:MAX)):  
1783 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1784 attribute. It is an integer value that ~~indicates a limit to the number of Job objects~~determines the  
1785 maximum number of jobs that a client will receive from the Printer even if "which-jobs" or "my-  
1786 jobs" constrain which jobs are returned. The limit is a "stateless limit" in that if the value  
1787 supplied by the client is 'N', then only the first 'N' jobs are returned in the Get-Jobs Response.  
1788 There is no mechanism to allow for the next 'M' jobs after the first 'N' jobs. If the client does not  
1789 supply this attribute, the Printer object responds with all applicable jobs. **Issue 8**

1790  
1791 "requested-attributes" (1setOf keyword):  
1792 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1793 attribute. It is a set of Job attribute names and/or attribute groups names in whose values the  
1794 requester is interested. This set of attributes is returned for each Job object that is returned. The  
1795 allowed attribute group names are the same as those defined in the Get-Job-Attributes operation  
1796 in section 3.3.4. If the client does not supply this attribute, the Printer MUST respond as if the  
1797 client had supplied this attribute with two values: 'job-uri' and 'job-id'.

1798  
1799 "which-jobs" (keyword):  
1800 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1801 attribute. It indicates which Job objects MUST be returned by the Printer object. The values for  
1802 this attribute are:

1803  
1804 'completed': This includes any Job object whose state is 'completed', 'canceled', or 'aborted'.  
1805 'not-completed': This includes any Job object whose state is 'pending', 'processing',  
1806 'processing-stopped', or 'pending-held'.

1807  
1808 A Printer object MUST support both values. However, if the implementation does not keep jobs  
1809 in the 'completed', 'canceled', and 'aborted' states, then it returns no jobs when the 'completed'  
1810 value is supplied.

1811  
1812 If a client supplies some other value, the Printer object MUST copy the attribute and the  
1813 unsupported value to the Unsupported Attributes response group, reject the request, and return  
1814 the 'client-error-attributes-or-values-not-supported' status code.

1815  
1816 If the client does not supply this attribute, the Printer object MUST respond as if the client had  
1817 supplied the attribute with a value of 'not-completed'.

1818  
1819 "my-jobs" (boolean):  
1820 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
1821 attribute. It indicates whether ~~all~~ jobs from all users or just the jobs submitted by the requesting  
1822 user of this request MUST be returned by the Printer object. If the client does not supply this

1823 attribute, the Printer object MUST respond as if the client had supplied the attribute with a value  
1824 of 'false', i.e., all-jobs:jobs from all users. The means for authenticating the requesting user and  
1825 matching the jobs is described in section 8.

### 1826 3.2.6.2 Get-Jobs Response

1827 The Printer object returns all of the Job objects up to the number specified by the "limit" attribute that  
1828 match the criteria as defined by the attribute values supplied by the client in the request. It is possible  
1829 that no Job objects are returned since there may literally be no Job objects at the Printer, or there may be  
1830 no Job objects that match the criteria supplied by the client. If the client requests any Job attributes at  
1831 all, there is a set of Job Object Attributes returned for each Job object.

1832 It is not an error for the Printer to return 0 jobs. If the response returns 0 jobs because there are no jobs  
1833 matching the criteria, and the request would have returned 1 or more jobs with a status code of  
1834 'successful-ok' if there had been jobs matching the criteria, then the status code for 0 jobs MUST be  
1835 'successful-ok'. Issue 24

### 1836 Group 1: Operation Attributes

#### 1837 Status Message:

1838 In addition to the REQUIRED status code returned in every response, the response  
1839 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
1840 and 3.1.6.

#### 1842 Natural Language and Character Set:

1843 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1844 3.1.4.2.

### 1846 Group 2: Unsupported Attributes

1847 See section 3.1.7 for details on returning Unsupported Attributes.

1848  
1849 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported~~  
1850 ~~by the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's~~  
1851 ~~Guide [IPP-IG]).~~ The response NEED NOT contain the "requested-attributes" operation  
1852 attribute with any supplied values (attribute keywords) that were requested by the client but are  
1853 not supported by the IPP object. If the Printer ~~object is not returning any Unsupported Attributes~~  
1854 ~~in the response, the Printer object SHOULD omit Group 2 rather than sending an empty group.~~  
1855 ~~However, a client MUST be able to accept an empty group.~~

1856 does include unsupported attributes referenced in "requested-attributes" and such attributes  
1857 include group names, such as 'all', the unsupported attributes MUST NOT include attributes  
1858 described in the standard but not supported by the implementation. Issue 23

### 1860 Groups 3 to N: Job Object Attributes

1861 The Printer object responds with one set of Job Object Attributes for each returned Job object.  
1862 The Printer object ignores (does not respond with) any requested attribute or value which is not

1863 supported or which is restricted by the security policy in force, including whether the requesting  
1864 user is the user that submitted the job (job originating user) or not (see section 8). However, the  
1865 Printer object MUST respond with the 'unknown' value for any supported attribute (including all  
1866 REQUIRED attributes) for which the Printer object does not know the value, unless it would  
1867 violate the security policy. See the description of the "out-of-band" values in the beginning of  
1868 Section 4.1.

1869

1870 Jobs are returned in the following order:

- 1871 - If the client requests all 'completed' Jobs (Jobs in the 'completed', 'aborted', or 'canceled'  
1872 states), then the Jobs are returned newest to oldest (with respect to actual completion  
1873 time)
- 1874 - If the client requests all 'not-completed' Jobs (Jobs in the 'pending', 'processing', 'pending-  
1875 held', and 'processing-stopped' states), then Jobs are returned in relative chronological  
1876 order of expected time to complete (based on whatever scheduling algorithm is  
1877 configured for the Printer object).

### 1878 3.2.7 Pause-Printer Operation

1879 This OPTIONAL operation allows a client to stop the Printer object from scheduling jobs on all its  
1880 devices. Depending on implementation, the Pause-Printer operation MAY also stop the Printer from  
1881 processing the current job or jobs. Any job that is currently being printed is either stopped as soon as the  
1882 implementation permits or is completed, depending on implementation. The Printer object MUST still  
1883 accept create operations to create new jobs, but MUST prevent any jobs from entering the 'processing'  
1884 state.

1885 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
1886 vice-versa.

1887 The IPP Printer stops the current job(s) on its device(s) that were in the 'processing' or 'processing-  
1888 stopped' states as soon as the implementation permits. If the implementation **Issue 30** will take  
1889 appreciable time to stop, the IPP Printer adds the 'moving-to-paused' value to the Printer object's  
1890 "printer-state-reasons" attribute (see section 4.4.12). When the device(s) have all stopped, the IPP  
1891 Printer transitions the Printer object to the 'stopped' state, removes the 'moving-to-paused' value, if  
1892 present, and adds the 'paused' value to the Printer object's "printer-state-reasons" attribute.

1893 When the current job(s) complete that were in the 'processing' state, the IPP Printer transitions them to  
1894 the 'completed' state. When the current job(s) stop in mid processing that were in the 'processing' state,  
1895 the IPP Printer transitions them to the 'processing-stopped' state and **Issue 30** adds the 'printer-stopped'  
1896 value to the job's "job-state-reasons" attribute.

1897 Note: for any jobs that are 'pending' or 'pending-held', the 'printer-stopped' value of the jobs' "job-state-  
1898 reasons" attribute also applies. However, the IPP Printer NEED NOT update those jobs' "job-state-  
1899 reasons" attributes and only need return the 'printer-stopped' value when those jobs are queried (so-called  
1900 "lazy evaluation").

1901 Whether the Pause-Printer operation affects jobs that were submitted to the device from other sources  
1902 than the IPP Printer object in the same way that the Pause-Printer operation affects jobs that were  
1903 submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP  
1904 protocol is being used as a universal management protocol or just to manage IPP jobs, respectively.

1905 The IPP Printer MUST accept the request in any state and transition the Printer to the indicated new  
1906 "printer-state" before returning as follows:

<u>Current "printer-state"</u>	<u>New "printer-state"</u>	<u>"printer-state-reasons"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'moving-to-paused'</u>	<u>OPTION 1: 'successful-ok';</u> <u>Later, when all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the 'moving-to-paused' value in the "printer-state-reasons" attribute</u>
<u>'processing'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>OPTION 2: 'successful-ok';</u> <u>all device output stopped immediately</u>
<u>'stopped'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>

1907 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
1908 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
1909 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-  
1910 authorized' as appropriate.

1911 3.2.7.1 Pause-Printer Request

1912 The following groups of attributes are part of the Pause-Printer Request:

1913 Group 1: Operation Attributes

1914 Natural Language and Character Set:

1915 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1916 3.1.4.1.

1917 Target:

1918 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1919 section 3.1.5.

1920 Requesting User Name:

1921 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1922 described in section 8.3.

1923 3.2.7.2 Pause-Printer Response

1924 The following groups of attributes are part of the Pause-Printer Response:

1927 Group 1: Operation Attributes

1928 Status Message:

1929 In addition to the REQUIRED status code returned in every response, the response  
1930 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
1931 and 3.1.6.

1932 Natural Language and Character Set:

1933 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
1934 3.1.4.2.

1935  
1936  
1937 Group 2: Unsupported Attributes

1938 See section 3.1.7 for details on returning Unsupported Attributes.

1939  
1940 3.2.8 Resume-Printer Operation

1941 This operation allows a client to resume the Printer object scheduling jobs on all its devices. The Printer  
1942 object **Issue 30** MUST remove the 'paused' and 'moving-to-paused' values from the Printer object's  
1943 "printer-state-reasons" attribute, if present. If there are no other reasons to keep a device paused (such as  
1944 media-jam), the IPP Printer transitions itself to the 'processing' or 'idle' states, depending on whether  
1945 there are jobs to be processed or not, respectively, and the device(s) resume processing jobs.

1946 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
1947 vice-versa.

1948 The IPP Printer removes the 'printer-stopped' value from any job's "job-state-reasons" attributes  
1949 contained in that Printer.

1950 The IPP Printer MUST accept the request in any state, transition the Printer object to the indicated new  
1951 state as follows:

<u>Current "printer-state"</u>	<u>New "printer-state"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'idle'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok'</u>
<u>'stopped'</u>	<u>'processing'</u>	<u>'successful-ok';</u> <u>when there are jobs to be processed</u>
<u>'stopped'</u>	<u>'idle'</u>	<u>'successful-ok';</u> <u>when there are no jobs to be processed.</u>

1952 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
1953 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
1954 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-  
1955 authorized' as appropriate.

1956 The Resume-Printer Request and Resume-Printer Response have the same attribute groups and attributes  
1957 as the Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

### 1958 3.2.9 Purge-Jobs Operation

1959 This OPTIONAL operation allows a client to remove all jobs from an IPP Printer object, regardless of  
1960 their job states, including jobs in the Printer object's Job History (see Section 4.3.7.1). After a Purge-  
1961 Jobs operation has been performed, a Printer object MUST return no jobs in subsequent Get-Job-  
1962 Attributes and Get-Jobs responses (until new jobs are submitted).

1963 Whether the Purge-Jobs (and Get-Jobs) operation affects jobs that were submitted to the device from  
1964 other sources than the IPP Printer object in the same way that the Purge-Jobs operation affects jobs that  
1965 were submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP  
1966 protocol is being used as a universal management protocol or just to manage IPP jobs, respectively.

1967 Note: if an operator wants to cancel all jobs without clearing out the Job History, the operator uses the  
1968 Cancel-Job operation on each job instead of using the Purge-Job operation.

1969 The Printer object MUST accept this operation in any state and transition the Printer object to the 'idle'  
1970 state.

1971 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
1972 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the  
1973 operation and return: client-error-forbidden, client-error-not-authenticated, and client-error-not-  
1974 authorized as appropriate.

1975 The Purge-Jobs Request and Purge-Jobs Response have the same attribute groups and attributes as the  
1976 Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1977

## 1978 3.3 Job Operations

1979 All Job operations are directed at Job objects. A client MUST always supply some means of identifying  
1980 the Job object in order to identify the correct target of the operation. That job identification MAY either  
1981 be a single Job URI or a combination of a Printer URI with a Job ID. The IPP object implementation  
1982 MUST support both forms of identification for every job.

### 1983 3.3.1 Send-Document Operation

1984 This OPTIONAL operation allows a client to create a multi-document Job object that is initially "empty"  
1985 (contains no documents). In the Create-Job response, the Printer object returns the Job object's URI (the  
1986 "job-uri" attribute) and the Job object's 32-bit identifier (the "job-id" attribute). For each new document  
1987 that the client desires to add, the client uses a Send-Document operation. Each Send-Document Request  
1988 contains the entire stream of document data for one document.

1989 If the Printer supports this operation but does not support multiple documents per job, the Printer MUST  
1990 reject subsequent Send-Document operations supplied with data and return the 'server-error-multiple-  
1991 document-jobs-not-supported'. However, the Printer MUST accept the first document with a 'true' or  
1992 'false' value for the "last-document" operation attribute (see below), so that clients MAY always submit  
1993 one document jobs with a 'false' value for "last-document" in the first Send-Document and a 'true' for  
1994 "last-document" in the second Send-Document (with no data). Issue 34

1995 Since the Create-Job and the send operations (Send-Document or Send-URI operations) that follow  
1996 could occur over an arbitrarily long period of time for a particular job, a client MUST send another send  
1997 operation within an IPP Printer defined minimum time interval after the receipt of the previous request  
1998 for the job. If a Printer object supports multiple document jobs, the Printer object MUST support the  
1999 "multiple-operation-time-out" attribute (see section 4.4.31). This attribute indicates the minimum  
2000 number of seconds the Printer object will wait for the next send operation before taking some recovery  
2001 action.

2002 An IPP object MUST recover from an errant client that does not supply a send operation, sometime after  
2003 the minimum time interval specified by the Printer object's "multiple-operation-time-out" attribute. Such  
2004 recovery MAY include any of the following or other recovery actions:

- 2005 1. Assume that the Job is an invalid job, start the process of changing the job state to 'aborted', add  
2006 the 'aborted-by-system' value to the job's "job-state-reasons" attribute (see section 4.3.8), ~~if~~  
2007 ~~supported,~~ Issue 30 and clean up all resources associated with the Job. In this case, if another  
2008 send operation is finally received, the Printer responds with an "client-error-not-possible" or  
2009 "client-error-not-found" depending on whether or not the Job object is still around when the send  
2010 operation finally arrives.
- 2011 2. Assume that the last send operation received was in fact the last document (as if the "last-  
2012 document" flag had been set to 'true'), close the Job object, and proceed to process it (i.e., move  
2013 the Job's state to 'pending').
- 2014 3. Assume that the last send operation received was in fact the last document, close the Job, but  
2015 move it to the 'pending-held' and add the 'submission-interrupted' value to the job's "job-state-  
2016 reasons" attribute (see section 4.3.8), ~~if supported.~~ 4.3.8). Issue 30 This action allows the user  
2017 or an operator to determine whether to continue processing the Job by moving it back to the  
2018 'pending' state using the Release-Job operation (see section 3.3.6) or to cancel the job using the  
2019 Cancel-Job operation (see section 3.3.3).

2021 Each implementation is free to decide the "best" action to take depending on local policy, whether any  
2022 documents have been added, whether the implementation spools jobs or not, and/or any other piece of  
2023 information available to it. If the choice is to abort the Job object, it is possible that the Job object may  
2024 already have been processed to the point that some media sheet pages have been printed.

2025 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
2026 owner (as determined in the Create-Job operation) or an operator or administrator of the Printer object  
2027 (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-  
2028 forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate. Issue 19

2029 3.3.1.1 Send-Document Request

2030 The following attribute sets are part of the Send-Document Request:

2031 Group 1: Operation Attributes

2032 Natural Language and Character Set:

2033 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
2034 3.1.4.1.

2035  
2036 Target:

2037 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation  
2038 attribute(s) which define the target for this operation as described in section 3.1.5.

2039  
2040 Requesting User Name:

2041 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
2042 described in section 8.3.

2043  
2044 "document-name" (name(MAX)):

2045 The client OPTIONALLY supplies this attribute. The Printer object MUST support this  
2046 attribute. It contains the client supplied document name. The document name MAY be different  
2047 than the Job name. It might be helpful, but NEED NOT be unique across multiple documents in  
2048 the same Job. Typically, the client software automatically supplies the document name on behalf  
2049 of the end user by using a file name or an application generated name. See the description of the  
2050 "document-name" operation attribute in the Print-Job Request (section 3.2.1.1) for more  
2051 information about this attribute.

2052  
2053 "compression" (type3 keyword)

2054 See the description of "compression" for the Print-Job operation in Section 3.2.1.1.

2055  
2056  
2057 "document-format" (mimeType) :

2058 ~~The client OPTIONALLY supplies this attribute. The Printer object MUST support this~~  
2059 ~~attribute. The value of this attribute identifies the format of the supplied document data. If the~~  
2060 ~~client does not supply this attribute, the Printer object assumes that the document data is in the~~  
2061 ~~format defined by the Printer object's "document format default" attribute. If the client supplies~~  
2062 ~~this attribute, but the value is not supported by the Printer object, i.e., the value is not one of the~~  
2063 ~~values of the Printer object's "document format supported" attribute, the Printer object MUST~~  
2064 ~~reject the request and return the 'client error document format not supported' status code. See the~~  
2065 ~~description of "document-format" for the Print-Job operation in Section 3.2.1.1. Issue 11~~

2066  
2067 "document-natural-language" (naturalLanguage):

2068 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
2069 this attribute. This attribute specifies the natural language of the document for those document-  
2070 formats that require a specification of the natural language in order to image the document  
2071 unambiguously. There are no particular values required for the Printer object to support.

2072

2073 "~~compression~~" (type3 keyword)

2074 ~~The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports~~  
2075 ~~this attribute and the "compression-supported" attribute (see section 4.4.29). The client supplied~~  
2076 ~~"compression" operation attribute identifies the compression algorithm used on the document~~  
2077 ~~data. If the client omits this attribute, the Printer object MUST assume that the data is not~~  
2078 ~~compressed. If the client supplies the attribute and the Printer object supports the attribute, the~~  
2079 ~~Printer object MUST use the corresponding decompression algorithm on the document data. If~~  
2080 ~~the client supplies this attribute, but the value is not supported by the Printer object, i.e., the value~~  
2081 ~~is not one of the values of the Printer object's "compression-supported" attribute, the Printer~~  
2082 ~~object MUST copy the attribute and its value to the Unsupported Attributes response group,~~  
2083 ~~reject the request, and return the 'client-error-attributes-or-values-not-supported' status code.~~

2084

2085 "last-document" (boolean):

2086 The client MUST supply this attribute. The Printer object MUST support this attribute. It is a  
2087 boolean flag that is set to 'true' if this is the last document for the Job, 'false' otherwise.

2088

2089 Group 2: Document Content

2090 The client MUST supply the document data if the "last-document" flag is set to 'false'. However,  
2091 since a client might not know that the previous document sent with a Send-Document (or Send-  
2092 URI) operation was the last document (i.e., the "last-document" attribute was set to 'false'), it is  
2093 legal to send a Send-Document request with no document data where the "last-document" flag is  
2094 set to 'true'. Such a request MUST NOT increment the value of the Job object's "number-of-  
2095 documents" attribute, since no real document was added to the job.

2096 3.3.1.2 Send-Document Response

2097 The following sets of attributes are part of the Send-Document Response:

2098 Group 1: Operation Attributes

2099 Status Message:

2100 In addition to the REQUIRED status code returned in every response, the response  
2101 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
2102 and 3.1.6.

2103

2104 Natural Language and Character Set:

2105 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
2106 3.1.4.2.

2107

2108 Group 2: Unsupported Attributes

2109 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported~~  
2110 ~~by the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's~~  
2111 ~~Guide [IPP-IG]). If the Printer object is not returning any Unsupported Attributes in the~~

2112 ~~response, the Printer object SHOULD omit Group 2 rather than sending an empty group.~~  
2113 ~~However, a client MUST be able to accept an empty group.~~  
2114 See section 3.1.7 for details on returning Unsupported Attributes.

2115 Group 3: Job Object Attributes

2116 This is the same set of attributes as described in the Print-Job response (see section 3.2.1.2).  
2117

2118 3.3.2 Send-URI Operation

2119 This OPTIONAL operation is identical to the Send-Document operation (see section 3.3.1) except that a  
2120 client MUST supply a URI reference ("document-uri" operation attribute) rather than the document data  
2121 itself. If a Printer object supports this operation, clients can use both Send-URI or Send-Document  
2122 operations to add new documents to an existing multi-document Job object. However, if a client needs  
2123 to indicate that the previous Send-URI or Send-Document was the last document, the client MUST use  
2124 the Send-Document operation with no document data and the "last-document" flag set to 'true' (rather  
2125 than using a Send-URI operation with no "document-uri" operation attribute).

2126 If a Printer object supports this operation, it MUST also support the Print-URI operation (see section  
2127 3.2.2).

2128 The Printer object MUST validate the syntax and URI scheme of the supplied URI before returning a  
2129 response, just as in the Print-URI operation.

2130 3.3.3 Cancel-Job Operation

2131 This REQUIRED operation allows a client to cancel a Print Job from the time the job is created up to the  
2132 time it is completed, canceled, or aborted. Since a Job might already be printing by the time a Cancel-  
2133 Job is received, some media sheet pages might be printed before the job is actually terminated.

2134 The IPP object MUST accept or reject the request based on the job's current state and transition the job  
2135 to the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'pending-held'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok' See Note 1</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible' See Note 2</u>
<u>'processing-stopped'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'successful-ok' See Note 1</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible' See Note 2</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2136 Note 1: If the implementation requires some measurable time to cancel the job in the 'processing' or  
 2137 'processing-stopped' job states, the IPP object MUST add the 'processing-to-stop-point' value to the job's  
 2138 "job-state-reasons" attribute and then transition the job to the 'canceled' state when the processing ceases  
 2139 (see section 4.3.8).

2140 Note 2: If the Job object already has the 'processing-to-stop-point' value in its "job-state-reasons"  
 2141 attribute, then the Printer object MUST reject a Cancel-Job operation.

2142 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2143 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2144 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2145 'client-error-not-authorized' as appropriate.

2146 3.3.3.1 Cancel-Job Request

2147 The following groups of attributes are part of the Cancel-Job Request:

2148 Group 1: Operation Attributes

2149 Natural Language and Character Set:

2150 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
 2151 3.1.4.1.

2152

2153 Target:

2154 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri)  
 2155 operation attribute(s) which define the target for this operation as described in section 3.1.5.

2156

2157 Requesting User Name:

2158 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
 2159 described in section 8.3.

2160

2161 "message" (text(127)):

2162 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports  
 2163 this attribute. It is a message to the operator. This "message" attribute is not the same as the "job-  
 2164 message-from-operator" attribute. That attribute is used to report a message from the operator to  
 2165 the end user that queries that attribute. This "message" operation attribute is used to send a  
 2166 message from the client to the operator along with the operation request. It is an implementation  
 2167 decision of how or where to display this message to the operator (if at all).

2168

2169 3.3.3.2 Cancel-Job Response

2170 The following sets of attributes are part of the Cancel-Job Response:

2171 Group 1: Operation Attributes

2172 Status Message:

2173 In addition to the REQUIRED status code returned in every response, the response  
2174 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
2175 and 3.1.6.

2176  
2177 ~~If the job is already in the 'completed', 'aborted', or 'canceled' state, or the 'process-to-stop-point'~~  
2178 ~~value is set in the Job's "job-state-reasons" attribute, the Printer object MUST reject the request~~  
2179 ~~and return the 'client-error-not-possible' error status code.~~

2180  
2181 Natural Language and Character Set:

2182 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
2183 3.1.4.2.

2184  
2185 Group 2: Unsupported Attributes

2186 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported~~  
2187 ~~by the Printer object or that conflict with one another (see section 3.2.1.2 and the Implementer's~~  
2188 ~~Guide [IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the~~  
2189 ~~response, the Printer object SHOULD omit Group 2 rather than sending an empty group.~~  
2190 ~~However, a client MUST be able to accept an empty group. See section 3.1.7 for details on~~  
2191 ~~returning Unsupported Attributes.~~

2192  
2193 Once a successful response has been sent, the implementation guarantees that the Job will eventually end  
2194 up in the 'canceled' state. Between the time of the Cancel-Job operation is accepted and when the job  
2195 enters the 'canceled' job-state (see section 4.3.7), the "job-state-reasons" attribute SHOULD contain the '  
2196 processing-to-stop-point' value which indicates to later queries that although the Job might still be  
2197 'processing', it will eventually end up in the 'canceled' state, not the 'completed' state.

2198 3.3.4 Get-Job-Attributes Operation

2199 This REQUIRED operation allows a client to request the values of attributes of a Job object and it is  
2200 almost identical to the Get-Printer-Attributes operation (see section 3.2.5). The only differences are that  
2201 the operation is directed at a Job object rather than a Printer object, there is no "document-format"  
2202 operation attribute used when querying a Job object, and the returned attribute group is a set of Job  
2203 object attributes rather than a set of Printer object attributes.

2204 For Jobs, the possible names of attribute groups are:

- 2205 - 'job-template': ~~all~~ the subset of the Job Template attributes that apply to a Job object (the first  
2206 column of the table in Section 4.2) that the implementation supports for Job objects.
- 2207 - 'job-description': ~~all~~ the subset of the Job Description attributes specified in Section 4.3 that the  
2208 implementation supports for Job objects.

2209 - 'all': the special group 'all' that includes all ~~supported attributes~~ attributes that the implementation  
2210 supports for Job objects. **Issue 23**  
2211

2212 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
2213 overlap. For example, if a client requests, 'job-name' and 'job-description', the client is actually  
2214 requesting the "job-name" attribute once by naming it explicitly, and once by inclusion in the 'job-  
2215 description' group. In such cases, the Printer object NEED NOT return the attribute only once in the  
2216 response even if it is requested multiple times. The client SHOULD NOT request the same attribute in  
2217 multiple ways.

2218 It is NOT REQUIRED that a Job object support all attributes belonging to a group (since some attributes  
2219 are OPTIONAL). However it is REQUIRED that each Job object support all group names.

#### 2220 3.3.4.1 Get-Job-Attributes Request

2221 The following groups of attributes are part of the Get-Job-Attributes Request when the request is  
2222 directed at a Job object:

##### 2223 Group 1: Operation Attributes

2224 Natural Language and Character Set:

2225 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
2226 3.1.4.1.

2227  
2228 Target:

2229 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri)  
2230 operation attribute(s) which define the target for this operation as described in section 3.1.5.

2231  
2232 Requesting User Name:

2233 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
2234 described in section 8.3.

2235  
2236 "requested-attributes" (1setOf keyword) :

2237 The client OPTIONALLY supplies this attribute. The IPP object MUST support this attribute.

2238 It is a set of attribute names and/or attribute group names in whose values the requester is  
2239 interested. If the client omits this attribute, the IPP object MUST respond as if this attribute had  
2240 been supplied with a value of 'all'.  
2241

#### 2242 3.3.4.2 Get-Job-Attributes Response

2243 The Printer object returns the following sets of attributes as part of the Get-Job-Attributes Response:

##### 2244 Group 1: Operation Attributes

2245 Status Message:  
2246 In addition to the REQUIRED status code returned in every response, the response  
2247 OPTIONALLY includes a "status-message" (text) operation attribute as described in sections 13  
2248 and 3.1.6.

2249  
2250 Natural Language and Character Set:  
2251 The "attributes-charset" and "attributes-natural-language" attributes as described in section  
2252 3.1.4.2. The "attributes-natural-language" MAY be the natural language of the Job object, rather  
2253 than the one requested.

2254  
2255 Group 2: Unsupported Attributes

2256 See section 3.1.7 for details on returning Unsupported Attributes.

2257  
2258 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported~~  
2259 ~~by the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's~~  
2260 ~~Guide [IPP-IG]).~~ The response NEED NOT contain the "requested-attributes" operation  
2261 attribute with any supplied values (attribute keywords) that were requested by the client but are  
2262 not supported by the IPP object. If the Printer ~~object is not returning any Unsupported Attributes~~  
2263 ~~in the response, the Printer object SHOULD omit Group 2 rather than sending an empty group.~~  
2264 ~~However, a client MUST be able to accept an empty group.~~  
2265 does include unsupported attributes referenced in "requested-attributes" and such attributes  
2266 include group names, such as 'all', the unsupported attributes MUST NOT include attributes  
2267 described in the standard but not supported by the implementation. Issue 23  
2268

2269 Group 3: Job Object Attributes

2270 This is the set of requested attributes and their current values. The IPP object ignores (does not  
2271 respond with) any requested attribute or value which is not supported or which is restricted by the  
2272 security policy in force, including whether the requesting user is the user that submitted the job  
2273 (job originating user) or not (see section 8). However, the IPP object MUST respond with the  
2274 'unknown' value for any supported attribute (including all REQUIRED attributes) for which the  
2275 IPP object does not know the value, unless it would violate the security policy. See the  
2276 description of the "out-of-band" values in the beginning of Section 4.1.

2277 3.3.5 Hold-Job Operation

2278 This OPTIONAL operation allows a client to hold a pending job in the queue so that it is not eligible for  
2279 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,  
2280 and vice-versa. The OPTIONAL "job-hold-until" operation attribute allows a client to specify whether  
2281 to hold the job indefinitely or until a specified time period, if supported.

2282 The IPP object MUST accept or reject the request based on the job's current state and transition the job  
2283 to the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
----------------------------	------------------------	--

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Note 1</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok' See Note 2</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Note 1</u>
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok' See Note 2</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2284 Note 1: If the implementation supports multiple reasons for a job to be in the 'pending-held' state, the  
 2285 IPP object MUST add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute.

2286 Note 2: If the IPP object supports the "job-hold-until" operation attribute, but the specified time period  
 2287 has already started (or is the 'no-hold' value) and there are no other reasons to hold the job, the IPP object  
 2288 MUST make the job be a candidate for processing immediately (see Section 4.2.2) by putting the job in  
 2289 the 'pending' state.

2290 Note: In order to keep the Hold-Job operation simple, such a request is rejected when the job is in the  
 2291 'processing' or 'processing-stopped' states. If an operation is needed to hold jobs while in these states, it  
 2292 will be added as an additional operation, rather than overloading the Hold-Job operation. Then it is clear  
 2293 to clients by querying the Printer object's "operations-supported" (see Section 4.4.15) and the Job  
 2294 object's "job-state" (see Section 4.3.7) attributes which operations are possible.

2295 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2296 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2297 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2298 'client-error-not-authorized' as appropriate.

2299 3.3.5.1 Hold-Job Request

2300 The groups and operation attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with  
 2301 the addition of the following Group 1 Operation attribute:

2302 "job-hold-until" (type3 keyword | name(MAX)):

2303 The client OPTIONALLY supplies this Operation attribute. The IPP object MUST support this  
 2304 operation attribute in a Hold-Job request, if it supports the "job-hold-until" Job template attribute  
 2305 in create operations. See section 4.2.2. The IPP object SHOULD support the "job-hold-until"  
 2306 Job Template attribute for use in job create operations with at least the 'indefinite' value, if it  
 2307 supports the Hold-Job operation. Otherwise, a client cannot create a job and hold it immediately  
 2308 (without picking some supported time period in the future).

2309 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP  
 2310 object copies the supplied operation attribute to the Job object, replacing the job's previous "job-

2311 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied  
2312 named time period.

2313 If supplied, but either the "job-hold-until" Operation attribute itself or the value supplied is not  
2314 supported, the IPP object accepts the request, returns the unsupported attribute or value in the  
2315 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-  
2316 substituted-attributes, and holds the job indefinitely until a client performs a subsequent Release-  
2317 Job operation.

2318 If the client (1) supplies a value that specifies a time period that has already started or the 'no-  
2319 hold' value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until"  
2320 operation attribute and there are no other reasons to hold the job, the IPP object MUST accept the  
2321 operation and make the job be a candidate for processing immediately (see Section 4.2.2).

2322 If the client does not supply a "job-hold-until" Operation attribute in the request, the IPP object  
2323 MUST populate the job object with a "job-hold-until" attribute with the 'indefinite' value (if IPP  
2324 object supports the "job-hold-until" attribute) and hold the job indefinitely, until a client performs  
2325 a Release-Job operation.

2326 3.3.5.2 Hold-Job Response

2327 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2328 3.3.6 Release-Job Operation

2329 This OPTIONAL operation allows a client to release a previously held job so that it is again eligible for  
2330 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,  
2331 and vice-versa.

2332 This operation removes the "job-hold-until" job attribute, if present, from the job object that had been  
2333 supplied in the create or most recent Hold-Job or Restart-Job operation and remove its effect on the job.  
2334 Issue 30 The IPP object MUST remove the 'job-hold-until-specified' value from the job's "job-state-  
2335 reasons" attribute, if present. See section 4.3.8.

2336 The IPP object MUST accept or reject the request based on the job's current state and transition the job  
2337 to the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Note 1</u>
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2338 Note 1: If there are other reasons to keep the job in the 'pending-held' state, such as 'resources-are-not-  
 2339 ready', the job remains in the 'pending-held' state. Thus the 'pending-held' state is not just for jobs that  
 2340 have the 'job-hold-until' applied to them, but are for any reason to keep the job from being a candidate  
 2341 for scheduling and processing, such as 'resources-are-not-ready'. See the "job-hold-until" attribute  
 2342 (section 4.2.2).

2343 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2344 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2345 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2346 'client-error-not-authorized' as appropriate.

2347 The Release-Job Request and Release-Job Response have the same attribute groups and attributes as the  
 2348 Cancel-Job operation (see section 3.3.3.1 and 3.3.3.2).

2349 3.3.7 Restart-Job Operation

2350 This OPTIONAL operation allows a client to restart a job that is retained in the queue after processing  
 2351 has completed (see section 4.3.7.1).

2352 The job is moved to the 'pending' job state and restarts at the beginning on the same IPP Printer object  
 2353 with the same attribute values. The Job Description attributes that accumulate job progress, such as  
 2354 "job-impressions-completed", "job-media-sheets-completed", and "job-k-octets-processed", MUST be  
 2355 reset to 0 so that they give an accurate record of the job from its restart point. The job object MUST  
 2356 continue to use the same "job-uri" and "job-id" attribute values.

2357 Note: If in the future an operation is needed that does not reset the job progress attributes, then a new  
 2358 operation will be defined which makes a copy of the job, assigns a new "job-uri" and "job-id" to the copy  
 2359 and resets the job progress attributes in the new copy only.

2360 The IPP object MUST accept or reject the request based on the job's current state, transition the job to  
 2361 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'client-error-not-possible'</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'client-error-not-possible'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u>
<u>'completed'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible' - see Note 1</u>
<u>'canceled'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible' - see Note 1</u>
<u>'aborted'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible' - see Note 1</u>

2362

2363 Note 1: If the Job Retention Period has expired for the job in this state, then the IPP object rejects the  
2364 operation. See section 4.3.7.1.

2365 Note: In order to prevent a user from inadvertently restarting a job in the middle, the Restart-Job request  
2366 is rejected when the job is in the 'processing' or 'processing-stopped' states. If in the future an operation  
2367 is needed to hold or restart jobs while in these states, it will be added as an additional operation, rather  
2368 than overloading the Restart-Job operation, so that it is clear that the user intended that the current job  
2369 not be completed.

2370 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
2371 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
2372 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
2373 'client-error-not-authorized' as appropriate.

2374 3.3.7.1 Restart-Job Request

2375 The groups and attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition  
2376 of the following Group 1 Operation attribute:

2377 "job-hold-until" (type3 keyword | name(MAX)):

2378 The client OPTIONALLY supplies this attribute. The IPP object MUST support this Operation  
2379 attribute in a Restart-Job request, if it supports the "job-hold-until" Job Template attribute in  
2380 create operations. See section 4.2.2. Otherwise, the IPP object NEED NOT support the "job-  
2381 hold-until" Operation attribute in a Restart-Job request.

2382 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP  
2383 object copies the supplied Operation attribute to the Job object, replacing the job's previous "job-  
2384 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied  
2385 named time period. See section 4.2.2.

2386 If supplied, but the value is not supported, the IPP object accepts the request, returns the  
2387 unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7,  
2388 returns the 'successful-ok-ignored-or-substituted-attributes' status code, and holds the job  
2389 indefinitely until a client performs a subsequent Release-Job operation.

2390 If supplied, but the "job-hold-until" Operation attribute itself is not supported, the IPP object  
2391 accepts the request, returns the unsupported attribute with the out-of-band 'unsupported' value in  
2392 the Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-  
2393 or-substituted-attributes' status code, and restarts the job, i.e., ignores the "job-hold-until"  
2394 attribute.

2395 If the client (1) supplies a value that specifies a time period that has already started or the 'no-  
2396 hold' value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until"

2397 operation attribute and there are no other reasons to hold the job, the IPP object makes the job a  
2398 candidate for processing immediately (see Section 4.2.2).

2399 If the client does not supply a "job-hold-until" operation attribute in the request, the IPP object  
2400 removes the "job-hold-until" attribute, if present, from the job. If there are no other reasons to  
2401 hold the job, the Restart-Job operation makes the job a candidate for processing immediately (see  
2402 Section 4.2.2).

### 2403 3.3.7.2 Restart-Job Response

2404 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2405 Note: In the future an OPTIONAL Modify-Job operation may be specified that allows the client to  
2406 modify other attributes before releasing the restarted job.

## 2407 4. Object Attributes

2408 This section describes the attributes with their corresponding attribute syntaxes and values that are part  
2409 of the IPP model. The sections below show the objects and their associated attributes which are  
2410 included within the scope of this protocol. Many of these attributes are derived from other relevant  
2411 specifications:

- 2412 - Document Printing Application (DPA) [ISO10175]
  - 2413 - RFC 1759 Printer MIB [RFC1759]
- 2414

2415 Each attribute is uniquely identified in this document using a "keyword" (see section 12.2.1) which is the  
2416 name of the attribute. The keyword is included in the section header describing that attribute.

2417 Note: Not only are keywords used to identify attributes, but one of the attribute syntaxes described  
2418 below is "keyword" so that some attributes have keyword values. Therefore, these attributes are defined  
2419 as having an attribute syntax that is a set of keywords.

### 2420 4.1 Attribute Syntaxes

2421 This section defines the basic attribute syntax types that all clients and IPP objects MUST be able to  
2422 accept in responses and accept in requests, respectively. Each attribute description in sections 3 and 4  
2423 includes the name of attribute syntax(es) in the heading (in parentheses). A conforming implementation  
2424 of an attribute MUST include the semantics of the attribute syntax(es) so identified. Section 6.3  
2425 describes how the protocol can be extended with new attribute syntaxes.

2426 The attribute syntaxes are specified in the following sub-sections, where the sub-section heading is the  
2427 keyword name of the attribute syntax inside the single quotes. In operation requests and responses each  
2428 attribute value MUST be represented as one of the attribute syntaxes specified in the sub-section heading  
2429 for the attribute. In addition, the value of an attribute in a response (but not in a request) MAY be one of

2430 the "out-of-band" values whose special encoding rules are defined in the "Encoding and Transport"  
2431 specification [IPP-PRO]. Standard "out-of-band" values are: Issue 12 and Issue 15

2432     `unknown`: The attribute is supported by the IPP object, but the value is unknown to the IPP object  
2433     for some reason.

2434     `unsupported`: The attribute is unsupported by the IPP object. This value MUST be returned only as  
2435     the value of an attribute in the Unsupported Attributes Group.

2436     `no-value`: The attribute is supported by the Printer object, but the system administrator has not yet  
2437     configured a value.

2438

2439 ~~The Encoding and Transport specification [IPP-PRO] defines mechanisms for passing "out-of-band"~~  
2440 ~~values.~~—All attributes in a request MUST have one or more values as defined in Sections 4.2 to 4.4.  
2441 Thus clients MUST NOT supply attributes with "out-of-band" values. All attributes in a response  
2442 MUST have one or more values as defined in Sections 4.2 to 4.4 or a single "out-of-band" value.

2443 Most attributes are defined to have a single attribute syntax. However, a few attributes (e.g., "job-sheet",  
2444 "media", "job-hold-until") are defined to have several attribute syntaxes, depending on the value. These  
2445 multiple attribute syntaxes are separated by the "|" character in the sub-section heading to indicate the  
2446 choice. Since each value MUST be tagged as to its attribute syntax in the protocol, a single-valued  
2447 attribute instance may have any one of its attribute syntaxes and a multi-valued attribute instance may  
2448 have a mixture of its defined attribute syntaxes.

#### 2449 4.1.1 `text`

2450 A text attribute is an attribute whose value is a sequence of zero or more characters encoded in a  
2451 maximum of 1023 (MAX) octets. MAX is the maximum length for each value of any text attribute.  
2452 However, if an attribute will always contain values whose maximum length is much less than MAX, the  
2453 definition of that attribute will include a qualifier that defines the maximum length for values of that  
2454 attribute. For example: the "printer-location" attribute is specified as "printer-location (text(127))". In  
2455 this case, text values for "printer-location" MUST NOT exceed 127 octets; if supplied with a longer text  
2456 string via some external interface (other than the protocol), implementations are free to truncate to this  
2457 shorter length limitation.

2458 In this specification, all text attributes are defined using the `text` syntax. However, `text` is used only for  
2459 brevity; the formal interpretation of `text` is: `textWithoutLanguage | textWithLanguage`. That is, for any  
2460 attribute defined in this specification using the `text` attribute syntax, all IPP objects and clients MUST  
2461 support both the `textWithoutLanguage` and `textWithLanguage` attribute syntaxes. However, in actual  
2462 usage and protocol execution, objects and clients accept and return only one of the two syntax per  
2463 attribute. The syntax `text` never appears "on-the-wire".

2464 Both `textWithoutLanguage` and `textWithLanguage` are needed to support the real world needs of  
2465 interoperability between sites and systems that use different natural languages as the basis for human  
2466 communication. Generally, one natural language applies to all text attributes in a given request or  
2467 response. The language is indicated by the "attributes-natural-language" operation attribute defined in  
2468 section 3.1.4 or "attributes-natural-language" job attribute defined in section 4.3.18, and there is no need

2469 to identify the natural language for each text string on a value-by-value basis. In these cases, the  
2470 attribute syntax 'textWithoutLanguage' is used for text attributes. In other cases, the client needs to  
2471 supply or the Printer object needs to return a text value in a natural language that is different from the  
2472 rest of the text values in the request or response. In these cases, the client or Printer object uses the  
2473 attribute syntax 'textWithLanguage' for text attributes (this is the Natural Language Override mechanism  
2474 described in section 3.1.4).

2475 The 'textWithoutLanguage' and 'textWithLanguage' attribute syntaxes are described in more detail in the  
2476 following sections.

#### 2477 4.1.1.1 'textWithoutLanguage'

2478 The 'textWithoutLanguage' syntax indicates a value that is sequence of zero or more characters. Text  
2479 strings are encoded using the rules of some charset. The Printer object MUST support the UTF-8  
2480 charset [\[RFC2044\]](#)[\[RFC2279\]](#) and MAY support additional charsets to represent 'text' values, provided  
2481 that the charsets are registered with IANA [IANA-CS]. See Section 4.1.7 for the specification of the  
2482 'charset' attribute syntax, including restricted semantics and examples of charsets.

#### 2483 4.1.1.2 'textWithLanguage'

2484 The 'textWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2485 'textWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides the  
2486 natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that  
2487 applies to the text part of that value and that value alone. For any give text attribute, the  
2488 'textWithoutLanguage' part is limited to the maximum length defined for that attribute, but the  
2489 'naturalLanguage' part is always limited to 63 octets. Using the 'textWithLanguage' attribute syntax rather  
2490 than the normal 'textWithoutLanguage' syntax is the so-called Natural Language Override mechanism  
2491 and MUST be supported by all IPP objects and clients.

2492 If the attribute is multi-valued (1setOf text), then the 'textWithLanguage' attribute syntax MUST be used  
2493 to explicitly specify each attribute value whose natural language needs to be overridden. Other values in  
2494 a multi-valued 'text' attribute in a request or a response revert to the natural language of the operation  
2495 attribute.

2496 In a create request, the Printer object MUST accept and store with the Job object any natural language in  
2497 the "attributes-natural-language" operation attribute, whether the Printer object supports that natural  
2498 language or not. Furthermore, the Printer object MUST accept and store any 'textWithLanguage'  
2499 attribute value, whether the Printer object supports that natural language or not. These requirements are  
2500 independent of the value of the "ipp-attribute-fidelity" operation attribute that the client MAY supply.

2501 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2502 indicating English, but the value of the "job-name" attribute is in French, the client MUST use the  
2503 'textWithLanguage' attribute syntax with the following two values:

2504       'fr': Natural Language Override indicating French  
2505       'Rapport Mensuel': the job name in French

2506

2507 See the ~~Encoding and Transport~~ "Encoding and Transport" document [IPP-PRO] for a detailed example  
2508 of the 'textWithLanguage' attribute syntax.

#### 2509 4.1.2 'name'

2510 This syntax type is used for user-friendly strings, such as a Printer name, that, for humans, are more  
2511 meaningful than identifiers. Names are never translated from one natural language to another. The  
2512 'name' attribute syntax is essentially the same as 'text', including the REQUIRED support of UTF-8  
2513 except that the sequence of characters is limited so that its encoded form MUST NOT exceed 255  
2514 (MAX) octets.

2515 Also like 'text', 'name' is really an abbreviated notation for either 'nameWithoutLanguage' or  
2516 'nameWithLanguage'. That is, all IPP objects and clients MUST support both the  
2517 'nameWithoutLanguage' and 'nameWithLanguage' attribute syntaxes. However, in actual usage and  
2518 protocol execution, objects and clients accept and return only one of the two syntax per attribute. The  
2519 syntax 'name' never appears "on-the-wire".

2520 Note: Only the 'text' and 'name' attribute syntaxes permit the Natural Language Override mechanism.

2521 Some attributes are defined as 'type3 keyword | name'. These attributes support values that are either  
2522 type3 keywords or names. This dual-syntax mechanism enables a site administrator to extend these  
2523 attributes to legally include values that are locally defined by the site administrator. Such names are not  
2524 registered with IANA.

##### 2525 4.1.2.1 'nameWithoutLanguage'

2526 The nameWithoutLanguage' syntax indicates a value that is sequence of zero or more characters so that  
2527 its encoded form does not exceed MAX octets.

##### 2528 4.1.2.2 'nameWithLanguage'

2529 The 'nameWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2530 'nameWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides  
2531 the natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that  
2532 applies to that name value and that name value alone.

2533 The 'nameWithLanguage' attribute syntax behaves the same as the 'textWithLanguage' syntax. If a name  
2534 is in a language that is different than the rest of the object or operation, then this 'nameWithLanguage'  
2535 syntax is used rather than the generic 'nameWithoutLanguage' syntax.

2536 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2537 indicating English, but the "printer-name" attribute is in German, the client MUST use the  
2538 'nameWithLanguage' attribute syntax as follows:

2539 'de': Natural Language Override indicating German

2540       Farbdrucker': the Printer name in German  
2541

#### 2542 4.1.2.3 Matching 'name' attribute values

2543 For purposes of matching two 'name' attribute values for equality, such as in job validation (where a  
2544 client-supplied value for attribute "xxx" is checked to see if the value is among the values of the Printer  
2545 object's corresponding "xxx-supported" attribute), the following match rules apply:

2546       1. 'keyword' values never match 'name' values.

2547       2. 'name' (nameWithoutLanguage and nameWithLanguage) values match if (1) the name parts  
2548 match and (2) the Associated Natural-Language parts (see section 3.1.4.1) match. The matching  
2549 rules are:

2550           a. the name parts match if the two names are identical character by character, except it is  
2551 RECOMMENDED that case be ignored. For example: 'Ajax-letter-head-white' MUST  
2552 match 'Ajax-letter-head-white' and SHOULD match 'ajax-letter-head-white' and 'AJAX-  
2553 LETTER-HEAD-WHITE'.

2554           b. the Associated Natural-Language parts match if the shorter of the two meets the  
2555 syntactic requirements of RFC 1766 [RFC1766] and matches byte for byte with the  
2556 longer. For example, 'en' matches 'en', 'en-us' and 'en-gb', but matches neither 'fr' nor 'e'.

#### 2557 4.1.3 'keyword'

2558 The 'keyword' attribute syntax is a sequence of characters, length: 1 to 255, containing only the US-  
2559 ASCII [ASCII] encoded values for lowercase letters ("a" - "z"), digits ("0" - "9"), hyphen ("-"), dot ("."),  
2560 and underscore ("\_"). The first character MUST be a lowercase letter. Furthermore, keywords MUST  
2561 be in U.S. English.

2562 This syntax type is used for enumerating semantic identifiers of entities in the abstract protocol, i.e.,  
2563 entities identified in this document. Keywords are used as attribute names or values of attributes.  
2564 Unlike 'text' and 'name' attribute values, 'keyword' values MUST NOT use the Natural Language  
2565 Override mechanism, since they MUST always be US-ASCII and U.S. English.

2566 Keywords are for use in the protocol. A user interface will likely provide a mapping between protocol  
2567 keywords and displayable user-friendly words and phrases which are localized to the natural language of  
2568 the user. While the keywords specified in this document MAY be displayed to users whose natural  
2569 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users,  
2570 since the user interface is outside the scope of this document.

2571 In the definition for each attribute of this syntax type, the full set of defined keyword values for that  
2572 attribute are listed.

2573 When a keyword is used to represent an attribute (its name), it MUST be unique within the full scope of  
2574 all IPP objects and attributes. When a keyword is used to represent a value of an attribute, it MUST be

2575 unique just within the scope of that attribute. That is, the same keyword MUST NOT be used for two  
2576 different values within the same attribute to mean two different semantic ideas. However, the same  
2577 keyword MAY be used across two or more attributes, representing different semantic ideas for each  
2578 attribute. Section 6.1 describes how the protocol can be extended with new keyword values. Examples  
2579 of attribute name keywords:

2580 "job-name"  
2581 "attributes-charset"  
2582

2583 Note: This document uses "type1", "type2", and "type3" prefixes to the "keyword" basic syntax to  
2584 indicate different levels of review for extensions (see section 6.1).

#### 2585 4.1.4 'enum'

2586 The 'enum' attribute syntax is an enumerated integer value that is in the range from 1 to  $2^{*}31 - 1$   
2587 (MAX). Each value has an associated 'keyword' name. In the definition for each attribute of this syntax  
2588 type, the full set of possible values for that attribute are listed. This syntax type is used for attributes for  
2589 which there are enum values assigned by other standards, such as SNMP MIBs. A number of attribute  
2590 enum values in this specification are also used for corresponding attributes in other standards  
2591 [RFC1759]. This syntax type is not used for attributes to which the ~~system~~ administrator may assign  
2592 values. Section 6.1 describes how the protocol can be extended with new enum values.

2593 Enum values are for use in the protocol. A user interface will provide a mapping between protocol enum  
2594 values and displayable user-friendly words and phrases which are localized to the natural language of the  
2595 user. While the enum symbols specified in this document MAY be displayed to users whose natural  
2596 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users,  
2597 since the user interface is outside the scope of this document.

2598 Note: SNMP MIBs use '2' for 'unknown' which corresponds to the IPP "out-of-band" value 'unknown'.  
2599 See the description of the "out-of-band" values at the beginning of Section 4.1. Therefore, attributes of  
2600 type 'enum' start at '3'.

2601 Note: This document uses "type1", "type2", and "type3" prefixes to the "enum" basic syntax to indicate  
2602 different levels of review for extensions (see section 6.1).

#### 2603 4.1.5 'uri'

2604 The 'uri' attribute syntax is any valid Uniform Resource Identifier or URI [RFC2396]. Most often, URIs  
2605 are simply Uniform Resource Locators or URLs. The maximum length of URIs used as values of IPP  
2606 attributes is 1023 octets. Although most other IPP attribute syntax types allow for only lower-cased  
2607 values, this attribute syntax type conforms to the case-sensitive and case-insensitive rules specified in  
2608 [RFC2396]. See also [IPP-IIG] for a discussion of case in URIs.

2609 4.1.6 'uriScheme'

2610 The 'uriScheme' attribute syntax is a sequence of characters representing a URI scheme according to  
2611 RFC 2396 [RFC2396]. Though RFC 2396 requires that the values be case-insensitive, IPP requires all  
2612 lower case values in IPP attributes to simplify comparing by IPP clients and Printer objects. Standard  
2613 values for this syntax type are the following keywords:

- 2614 'http': for HTTP schemed URIs (e.g., "~~http:...~~""http:...")
- 2615 'https': for use with HTTPS schemed URIs (e.g., "https:...") (not on IETF standards track)
- 2616 'ftp': for FTP schemed URIs (e.g., "ftp:...")
- 2617 'mailto': for SMTP schemed URIs (e.g., "mailto:...")
- 2618 'file': for file schemed URIs (e.g., "file:...")

2620 A Printer object MAY support any URI 'scheme' that has been registered with IANA [IANA-MT]. The  
2621 maximum length of URI 'scheme' values used to represent IPP attribute values is 63 octets.

2622 4.1.7 'charset'

2623 The 'charset' attribute syntax is a standard identifier for a charset. A charset is a coded character set and  
2624 encoding scheme. Charsets are used for labeling certain document contents and 'text' and 'name'  
2625 attribute values. The syntax and semantics of this attribute syntax are specified in RFC 2046 [RFC2046]  
2626 and contained in the IANA character-set Registry [IANA-CS] according to the IANA procedures  
2627 [RFC2278]. Though RFC 2046 requires that the values be case-insensitive US-ASCII, IPP requires all  
2628 lower case values in IPP attributes to simplify comparing by IPP clients and Printer objects. When a  
2629 character-set in the IANA registry has more than one name (alias), the name labeled as "(preferred  
2630 MIME name)", if present, MUST be used.

2631 The maximum length of 'charset' values used to represent IPP attribute values is 63 octets.

2632 Some examples are:

- 2633 'utf-8': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as the UTF-8  
2634 [RFC2279] transfer encoding scheme in which US-ASCII is a subset charset.
- 2635 'us-ascii': 7-bit American Standard Code for Information Interchange (ASCII), ANSI X3.4-1986  
2636 [ASCII]. That standard defines US-ASCII, but RFC 2045 [RFC2045] eliminates most of the  
2637 control characters from conformant usage in MIME and IPP.
- 2638 'iso-8859-1': 8-bit One-Byte Coded Character Set, Latin Alphabet Nr 1 [ISO8859-1]. That standard  
2639 defines a coded character set that is used by Latin languages in the Western Hemisphere and  
2640 Western Europe. US-ASCII is a subset charset.
- 2641 'iso-10646-ucs-2': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as  
2642 two octets (UCS-2), with the high order octet of each pair coming first (so-called Big Endian  
2643 integer).

2645 Some attribute descriptions MAY place additional requirements on charset values that may be used, such  
2646 as REQUIRED values that MUST be supported or additional restrictions, such as requiring that the  
2647 charset have US-ASCII as a subset charset.

2648 4.1.8 'naturalLanguage'

2649 The 'naturalLanguage' attribute syntax is a standard identifier for a natural language and optionally a  
2650 country. The values for this syntax type are defined by RFC 1766 [RFC1766]. Though RFC 1766  
2651 requires that the values be case-insensitive US-ASCII, IPP requires all lower case to simplify comparing  
2652 by IPP clients and Printer objects. Examples include:

2653 'en': for English  
2654 'en-us': for US English  
2655 'fr': for French  
2656 'de': for German

2657

2658 The maximum length of 'naturalLanguage' values used to represent IPP attribute values is 63 octets.

2659 4.1.9 'mimeType'

2660 The 'mimeType' attribute syntax is the Internet Media Type (sometimes called MIME type) as  
2661 defined by RFC 2046 [RFC2046] and registered according to the procedures of RFC 2048 [RFC2048]  
2662 for identifying a document format. The value MAY include a charset parameter, depending on the  
2663 specification of the Media Type in the IANA Registry [IANA-MT]. Although most other IPP syntax  
2664 types allow for only lower-cased values, this syntax type allows for mixed-case values which are case-  
2665 insensitive.

2666 Examples are:

2667 'text/html': An HTML document  
2668 'text/plain': A plain text document in US-ASCII (RFC 2046 indicates that in the absence of the  
2669 charset parameter MUST mean US-ASCII rather than simply unspecified) [RFC2046].  
2670 'text/plain; charset=US-ASCII': A plain text document in US-ASCII [52, 56].  
2671 'text/plain; charset=ISO-8859-1': A plain text document in ISO 8859-1 (Latin 1) [ISO8859-1].  
2672 'text/plain; charset=utf-8': A plain text document in ISO 10646 represented as UTF-8  
2673 ~~[RFC2044][RFC2279]~~  
2674 ~~'text/plain, charset=iso-10646-ucs-2': A plain text document in ISO 10646 represented in two octets~~  
2675 ~~(UCS-2) [ISO10646-1]~~  
2676 'application/postscript': A PostScript document [RFC2046]  
2677 'application/vnd.hp-PCL': A PCL document [IANA-MT] (charset escape sequence embedded in the  
2678 document data)  
2679 'application/pdf': Portable Document Format - see IANA MIME Media Type registry  
2680 'application/octet-stream': Auto-sense - see below

2681

2682

2683 4.1.9.1 Application/octet-stream -- Auto-Sensing the document format

2684 One special type is 'application/octet-stream'. If the Printer object supports this value, the Printer object  
2685 MUST be capable of auto-sensing the format of the document data, either as part of the create operation

2686 and/or at document processing time. During auto-sensing, a Printer may determine that the document-  
2687 data has a format data. that the Printer doesn't recognize. If the Printer determines this problem before  
2688 returning an operation response, it rejects the request and returns the 'client-error-document-format-not-  
2689 supported' status code. If the Printer determines this problem after accepting the request and returning  
2690 an operation response with one of the successful status codes, the Printer adds the 'unsupported-  
2691 document-format' value to the job's "job-state-reasons" attribute. Issue 9 and Issue 10

2692 If the Printer object's default value attribute "document-format-default" is set to 'application/octet-  
2693 stream', the Printer object not only supports auto-sensing of the document format, but will depend on the  
2694 result of applying its auto-sensing when the client does not supply the "document-format" attribute. If  
2695 the client supplies a document format value, the Printer MUST rely on the supplied attribute, rather than  
2696 trust its auto-sensing algorithm. To summarize:

- 2697 1. If the client does not supply a document format value, the Printer MUST rely on its default value  
2698 setting (which may be 'application/octet-stream' indicating an auto-sensing mechanism).
- 2699 2. If the client supplies a value other than 'application/octet-stream', the client is supplying valid  
2700 information about the format of the document data and the Printer object MUST trust the client  
2701 supplied value more than the outcome of applying an automatic format detection mechanism.  
2702 For example, the client may be requesting the printing of a PostScript file as a 'text/plain'  
2703 document. The Printer object MUST print a text representation of the PostScript commands  
2704 rather than interpret the stream of PostScript commands and print the result.
- 2705 3. If the client supplies a value of 'application/octet-stream', the client is indicating that the Printer  
2706 object MUST use its auto-sensing mechanism on the client supplied document data whether  
2707 auto-sensing is the Printer object's default or not.

2709 Note: Since the auto-sensing algorithm is probabilistic, if the client requests both auto-sensing  
2710 ("document-format" set to 'application/octet-stream') and true fidelity ("ipp-attribute-fidelity" set to  
2711 'true'), the Printer object might not be able to guarantee exactly what the end user intended (the auto-  
2712 sensing algorithm might mistake one document format for another ), but it is able to guarantee that its  
2713 auto-sensing mechanism be used.

2714 The maximum length of a 'mimeType' value to represent IPP attribute values is 255 octets.

#### 2715 4.1.10 'octetString'

2716 The 'octetString' attribute syntax is a sequence of octets encoded in a maximum of 1023 octets which is  
2717 indicated in sub-section headers using the notation: octetString(MAX). This syntax type is used for  
2718 opaque data.

#### 2719 4.1.11 'boolean'

2720 The 'boolean' attribute syntax has only two values: 'true' and 'false'.

2721 4.1.12 'integer'

2722 The 'integer' attribute syntax is an integer value that is in the range from  $-2^{31}$  (MIN) to  $2^{31} - 1$   
2723 (MAX). Each individual attribute may specify the range constraint explicitly in sub-section headers if  
2724 the range is different from the full range of possible integer values. For example: job-priority  
2725 (integer(1:100)) for the "job-priority" attribute. However, the enforcement of that additional constraint is  
2726 up to the IPP objects, not the protocol.

2727 4.1.13 'rangeOfInteger'

2728 The 'rangeOfInteger' attribute syntax is an ordered pair of integers that defines an inclusive range of  
2729 integer values. The first integer specifies the lower bound and the second specifies the upper bound. If a  
2730 range constraint is specified in the header description for an attribute in this document whose attribute  
2731 syntax is 'rangeOfInteger' (i.e., 'X:Y' indicating X as a minimum value and Y as a maximum value), then  
2732 the constraint applies to both integers.

2733 4.1.14 'dateTime'

2734 The 'dateTime' attribute syntax is a standard, fixed length, 11 octet representation of the "DateAndTime"  
2735 syntax as defined in RFC 1903 [RFC1903]. RFC 1903 also identifies an 8 octet representation of a  
2736 "DateAndTime" value, but IPP objects MUST use the 11 octet representation. A user interface will  
2737 provide a mapping between protocol dateTime values and displayable user-friendly words or  
2738 presentation values and phrases which are localized to the natural language and date format of the user.

2739 4.1.15 'resolution'

2740 The 'resolution' attribute syntax specifies a two-dimensional resolution in the indicated units. It consists  
2741 of 3 values: a cross feed direction resolution (positive integer value), a feed direction resolution (positive  
2742 integer value), and a units value. The semantics of these three components are taken from the Printer  
2743 MIB [RFC1759] suggested values. That is, the cross feed direction component resolution component is  
2744 the same as the prtMarkerAddressabilityXFeedDir object in the Printer MIB, the feed direction  
2745 component resolution component is the same as the prtMarkerAddressabilityFeedDir in the Printer MIB,  
2746 and the units component is the same as the prtMarkerAddressabilityUnit object in the Printer MIB  
2747 (namely, '3' indicates dots per inch and '4' indicates dots per centimeter). All three values MUST be  
2748 present even if the first two values are the same. Example: '300', '600', '3' indicates a 300 dpi cross-feed  
2749 direction resolution, a 600 dpi feed direction resolution, since a '3' indicates dots per inch (dpi).

2750 4.1.16 '1setOf X'

2751 The '1setOf X' attribute syntax is 1 or more values of attribute syntax type X. This syntax type is used  
2752 for multi-valued attributes. The syntax type is called '1setOf' rather than just 'setOf' as a reminder that  
2753 the set of values MUST NOT be empty (i.e., a set of size 0). Sets are normally unordered. However  
2754 each attribute description of this type may specify that the values MUST be in a certain order for that  
2755 attribute.

2756 4.2 Job Template Attributes

2757 Job Template attributes describe job processing behavior. Support for Job Template attributes by a  
2758 Printer object is OPTIONAL (see section 12.2.3 for a description of support for OPTIONAL attributes).  
2759 Also, clients OPTIONALLY supply Job Template attributes in create requests.

2760 Job Template attributes conform to the following rules. For each Job Template attribute called "xxx":

2761 1. If the Printer object supports "xxx" then it MUST support both a "xxx-default" attribute (unless  
2762 there is a "No" in the table below) and a "xxx-supported" attribute. If the Printer object doesn't  
2763 support "xxx", then it MUST support neither an "xxx-default" attribute nor an "xxx-supported"  
2764 attribute, and it MUST treat an attribute "xxx" supplied by a client as unsupported. An attribute  
2765 "xxx" may be supported for some document formats and not supported for other document  
2766 formats. For example, it is expected that a Printer object would only support "orientation-  
2767 requested" for some document formats (such as 'text/plain' or 'text/html') but not others (such as  
2768 'application/postscript').

2769  
2770 2. "xxx" is OPTIONALLY supplied by the client in a create request. If "xxx" is supplied, the client  
2771 is indicating a desired job processing behavior for this Job. When "xxx" is not supplied, the  
2772 client is indicating that the Printer object apply its default job processing behavior at job  
2773 processing time if the document content does not contain an embedded instruction indicating an  
2774 xxx-related behavior.

2775  
2776 Note: Since an administrator MAY change the default value attribute after a Job object has been  
2777 submitted but before it has been processed, the default value used by the Printer object at job  
2778 processing time may be different that the default value in effect at job submission time.

2779  
2780 3. The "xxx-supported" attribute is a Printer object attribute that describes which job processing  
2781 behaviors are supported by that Printer object. A client can query the Printer object to find out  
2782 what xxx-related behaviors are supported by inspecting the returned values of the "xxx-  
2783 supported" attribute.

2784  
2785 Note: The "xxx" in each "xxx-supported" attribute name is singular, even though an "xxx-  
2786 supported" attribute usually has more than one value, such as "job-sheet-supported", unless the  
2787 "xxx" Job Template attribute is plural, such as "finishings" or "sides". In such cases the "xxx-  
2788 supported" attribute names are: "finishings-supported" and "sides-supported".

2789  
2790 4. The "xxx-default" default value attribute describes what will be done at job processing time when  
2791 no other job processing information is supplied by the client (either explicitly as an IPP attribute  
2792 in the create request or implicitly as an embedded instruction within the document data).

2793  
2794 If an application wishes to present an end user with a list of supported values from which to choose, the  
2795 application SHOULD query the Printer object for its supported value attributes. The application  
2796 SHOULD also query the default value attributes. If the application then limits selectable values to only  
2797 those value that are supported, the application can guarantee that the values supplied by the client in the

2798 create request all fall within the set of supported values at the Printer. When querying the Printer, the  
2799 client MAY enumerate each attribute by name in the Get-Printer-Attributes Request, or the client MAY  
2800 just name the "job-template" group in order to get the complete set of supported attributes (both  
2801 supported and default attributes).

2802 The "finishings" attribute is an example of a Job Template attribute. It can take on a set of values such  
2803 as 'staple', 'punch', and/or 'cover'. A client can query the Printer object for the "finishings-supported"  
2804 attribute and the "finishings-default" attribute. The supported attribute contains a set of supported  
2805 values. The default value attribute contains the finishing value(s) that will be used for a new Job if the  
2806 client does not supply a "finishings" attribute in the create request and the document data does not  
2807 contain any corresponding finishing instructions. If the client does supply the "finishings" attribute in  
2808 the create request, the IPP object validates the value or values to make sure that they are a subset of the  
2809 supported values identified in the Printer object's "finishings-supported" attribute. See section 3.1.7.

2810 The table below summarizes the names and relationships for all Job Template attributes. The first  
2811 column of the table (labeled "Job Attribute") shows the name and syntax for each Job Template attribute  
2812 in the Job object. These are the attributes that can optionally be supplied by the client in a create request.  
2813 The last two columns (labeled "Printer: Default Value Attribute" and "Printer: Supported Values  
2814 Attribute") shows the name and syntax for each Job Template attribute in the Printer object (the default  
2815 value attribute and the supported values attribute). A "No" in the table means the Printer MUST NOT  
2816 support the attribute (that is, the attribute is simply not applicable). For brevity in the table, the 'text' and  
2817 'name' entries do not show the maximum length for each attribute.

2818	+=====+	+=====+	+=====+

2879  
 2880

2881 4.2.1 job-priority (integer(1:100))

2882 This attribute specifies a priority for scheduling the Job. A higher value specifies a higher priority. The  
 2883 value 1 indicates the lowest possible priority. The value 100 indicates the highest possible priority.  
 2884 Among those jobs that are ready to print, a Printer MUST print all jobs with a priority value of n before  
 2885 printing those with a priority value of n-1 for all n.

2886 If the Printer object supports this attribute, it MUST always support the full range from 1 to 100. No  
 2887 administrative restrictions are permitted. This way an end-user can always make full use of the entire  
 2888 range with any Printer object. If privileged jobs are implemented outside ~~IPP/1.0,IPP/1.1~~, they MUST  
 2889 have priorities higher than 100, rather than restricting the range available to end-users.

2890 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer  
 2891 object MUST use the value of the Printer object's "job-priority-default" at job submission time (unlike  
 2892 most Job Template attributes that are used if necessary at job processing time).

2893 The syntax for the "job-priority-supported" is also integer(1:100). This single integer value indicates the  
 2894 number of priority levels supported. The Printer object MUST take the value supplied by the client and  
 2895 map it to the closest integer in a sequence of n integers values that are evenly distributed over the range  
 2896 from 1 to 100 using the formula:

2897 
$$\text{roundToNearestInt}((100x+50)/n)$$

2898 where n is the value of "job-priority-supported" and x ranges from 0 through n-1.

2899 For example, if n=1 the sequence of values is 50; if n=2, the sequence of values is: 25 and 75; if n = 3,  
 2900 the sequence of values is: 17, 50 and 83; if n = 10, the sequence of values is: 5, 15, 25, 35, 45, 55, 65,  
 2901 75, 85, and 95; if n = 100, the sequence of values is: 1, 2, 3, ... 100.

2902 If the value of the Printer object's "job-priority-supported" is 10 and the client supplies values in the  
 2903 range 1 to 10, the Printer object maps them to 5, in the range 11 to 20, the Printer object maps them to  
 2904 15, etc.

2905 4.2.2 job-hold-until (type3 keyword | name (MAX))

2906 This attribute specifies the named time period during which the Job MUST become a candidate for  
2907 printing.

2908 Standard keyword values for named time periods are:

2909     'no-hold': immediately, if there are not other reasons to hold the job

2910     'indefinite': - the job is held indefinitely, until a client performs a Release-Job (section 3.3.6)

2911     'day-time': during the day

2912     'evening': evening

2913     'night': night

2914     'weekend': weekend

2915     'second-shift': second-shift (after close of business)

2916     'third-shift': third-shift (after midnight)

2917

2918 An administrator MUST associate allowable print times with a named time period (by means outside  
2919 IPP/1.0); the scope of this IPP/1.1 document). An administrator is encouraged to pick names that suggest  
2920 the type of time period. An administrator MAY define additional values using the 'name' or 'keyword'  
2921 attribute syntax, depending on implementation.

2922 If the value of this attribute specifies a time period that is in the future, the Printer MUST add the 'job-  
2923 hold-until-specified' value to the job's "job-state-reasons" attribute, move the job to the 'pending-held'  
2924 state, and MUST NOT schedule the job for printing until the specified time-period arrives. When the  
2925 specified time period arrives, the Printer MUST remove the 'job-hold-until-specified' value from the  
2926 job's "job-state-reason" attribute and, if there are no other job state reasons that keep the job in the  
2927 'pending-held' state, the Printer MUST consider the job as a candidate for processing by moving the job  
2928 to the 'pending' state.

2929 If this job attribute value is the named value 'no-hold', or the specified time period has already started,  
2930 the job MUST be a candidate for processing immediately.

2931 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer  
2932 object MUST use the value of the Printer object's "job-hold-until-default" at job submission time (unlike  
2933 most Job Template attributes that are used if necessary at job processing time).

2934 4.2.3 job-sheets (type3 keyword | name(MAX))

2935 This attribute determines which job start/end sheet(s), if any, MUST be printed with a job.

2936 Standard keyword values are:

2937     'none': no job sheet is printed

2938     'standard': one or more site specific standard job sheets are printed, e.g. a single start sheet or both  
2939     start and end sheet is printed

2940

2941 An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending  
2942 on implementation.

2943 Note: The effect of this attribute on jobs with multiple documents MAY be affected by the "multiple-  
2944 document-handling" job attribute (section 4.2.4), depending on the job sheet semantics.

#### 2945 4.2.4 multiple-document-handling (type2 keyword)

2946 This attribute is relevant only if a job consists of two or more documents. This attribute MUST be  
2947 supported if the Printer supports multiple documents per job (see sections 3.2.4 and 3.3.1). **Issue 34** The  
2948 attribute controls finishing operations and the placement of one or more print-stream pages into  
2949 impressions and onto media sheets. When the value of the "copies" attribute exceeds 1, it also controls  
2950 the order in which the copies that result from processing the documents are produced. For the purposes  
2951 of this explanation, if "a" represents an instance of document data, then the result of processing the data  
2952 in document "a" is a sequence of media sheets represented by "a(\*)".

2953 Standard keyword values are:

2954 'single-document': If a Job object has multiple documents, say, the document data is called a and b,  
2955 then the result of processing all the document data (a and then b) MUST be treated as a single  
2956 sequence of media sheets for finishing operations; that is, finishing would be performed on the  
2957 concatenation of the sequences a(\*),b(\*). The Printer object MUST NOT force the data in each  
2958 document instance to be formatted onto a new print-stream page, nor to start a new impression  
2959 on a new media sheet. If more than one copy is made, the ordering of the sets of media sheets  
2960 resulting from processing the document data MUST be a(\*), b(\*), a(\*), b(\*), ..., and the Printer  
2961 object MUST force each copy (a(\*),b(\*)) to start on a new media sheet.

2962 'separate-documents-uncollated-copies': If a Job object has multiple documents, say, the document  
2963 data is called a and b, then the result of processing the data in each document instance MUST be  
2964 treated as a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*)  
2965 would each be finished separately. The Printer object MUST force each copy of the result of  
2966 processing the data in a single document to start on a new media sheet. If more than one copy is  
2967 made, the ordering of the sets of media sheets resulting from processing the document data  
2968 MUST be a(\*), a(\*), ..., b(\*), b(\*) ... .

2969 'separate-documents-collated-copies': If a Job object has multiple documents, say, the document data  
2970 is called a and b, then the result of processing the data in each document instance MUST be  
2971 treated as a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*)  
2972 would each be finished separately. The Printer object MUST force each copy of the result of  
2973 processing the data in a single document to start on a new media sheet. If more than one copy is  
2974 made, the ordering of the sets of media sheets resulting from processing the document data  
2975 MUST be a(\*), b(\*), a(\*), b(\*), ... .

2976 'single-document-new-sheet': Same as 'single-document', except that the Printer object MUST  
2977 ensure that the first impression of each document instance in the job is placed on a new media  
2978 sheet. This value allows multiple documents to be stapled together with a single staple where  
2979 each document starts on a new sheet.  
2980

2981 The 'single-document' value is the same as 'separate-documents-collated-copies' with respect to ordering  
2982 of print-stream pages, but not media sheet generation, since 'single-document' will put the first page of  
2983 the next document on the back side of a sheet if an odd number of pages have been produced so far for  
2984 the job, while 'separate-documents-collated-copies' always forces the next document or document copy  
2985 on to a new sheet. In addition, if the "finishings" attribute specifies 'staple', then with 'single-document',  
2986 documents a and b are stapled together as a single document with no regard to new sheets, with 'single-  
2987 document-new-sheet', documents a and b are stapled together as a single document, but document b  
2988 starts on a new sheet, but with 'separate-documents-uncollated-copies' and 'separate-documents-collated-  
2989 copies', documents a and b are stapled separately.

2990 Note: None of these values provide means to produce uncollated sheets within a document, i.e., where  
2991 multiple copies of sheet n are produced before sheet n+1 of the same document.

2992 The relationship of this attribute and the other attributes that control document processing is described in  
2993 section 15.3.

#### 2994 4.2.5 copies (integer(1:MAX))

2995 This attribute specifies the number of copies to be printed.

2996 On many devices the supported number of collated copies will be limited by the number of physical  
2997 output bins on the device, and may be different from the number of uncollated copies which can be  
2998 supported.

2999 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3000 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3001 attributes that control document processing is described in section 15.3.

#### 3002 4.2.6 finishings (1setOf type2 enum)

3003 This attribute identifies the finishing operations that the Printer uses for each copy of each printed  
3004 document in the Job. For Jobs with multiple documents, the "multiple-document-handling" attribute  
3005 determines what constitutes a "copy" for purposes of finishing.

3006 Standard enum values are:

3007	Value	Symbolic Name and Description
3008		
3009	'3'	'none': Perform no finishing
3010	'4'	'staple': Bind the document(s) with one or more staples. The exact number and placement
3011		of the staples is site-defined.
3012	'5'	'punch': This value indicates that holes are required in the finished document. The exact
3013		number and placement of the holes is site-defined The punch specification MAY
3014		be satisfied (in a site- and implementation-specific manner) either by
3015		drilling/punching, or by substituting pre-drilled media.

- 3016 '6' 'cover': This value is specified when it is desired to select a non-printed (or pre-printed)  
3017 cover for the document. This does not supplant the specification of a printed cover  
3018 (on cover stock medium) by the document itself.
- 3019 '7' 'bind': This value indicates that a binding is to be applied to the document; the type and  
3020 placement of the binding is site-defined."
- 3021
- 3022 '8' 'saddle-stitch': Bind the document(s) with one or more staples (wire stitches) along the  
3023 middle fold. The exact number and placement of the staples and the middle fold  
3024 is implementation and/or site-defined.
- 3025 '9' 'edge-stitch': Bind the document(s) with one or more staples (wire stitches) along one  
3026 edge. The exact number and placement of the staples is implementation and/or  
3027 site-defined.
- 3028 '10'-'19' reserved for future generic finishing enum values.

3029 The following values are more specific; they indicate a corner or an edge as if the document were a  
3030 portrait document (see below):

- 3031 '20' 'staple-top-left': Bind the document(s) with one or more staples in the top left corner.
- 3032 '21' 'staple-bottom-left': Bind the document(s) with one or more staples in the bottom left  
3033 corner.
- 3034 '22' 'staple-top-right': Bind the document(s) with one or more staples in the top right corner.
- 3035 '23' 'staple-bottom-right': Bind the document(s) with one or more staples in the bottom right  
3036 corner.
- 3037 '24' 'edge-stitch-left': Bind the document(s) with one or more staples (wire stitches) along the  
3038 left edge. The exact number and placement of the staples is implementation  
3039 and/or site-defined.
- 3040 '25' 'edge-stitch-top': Bind the document(s) with one or more staples (wire stitches) along the  
3041 top edge. The exact number and placement of the staples is implementation  
3042 and/or site-defined.
- 3043 '26' 'edge-stitch-right': Bind the document(s) with one or more staples (wire stitches) along  
3044 the right edge. The exact number and placement of the staples is implementation  
3045 and/or site-defined.
- 3046 '27' 'edge-stitch-bottom': Bind the document(s) with one or more staples (wire stitches) along  
3047 the bottom edge. The exact number and placement of the staples is  
3048 implementation and/or site-defined.
- 3049 '28' 'staple-dual-left': Bind the document(s) with two staples (wire stitches) along the left  
3050 edge assuming a portrait document (see above).
- 3051 '29' 'staple-dual-top': Bind the document(s) with two staples (wire stitches) along the top  
3052 edge assuming a portrait document (see above).
- 3053 '30' 'staple-dual-right': Bind the document(s) with two staples (wire stitches) along the right  
3054 edge assuming a portrait document (see above).
- 3055 '31' 'staple-dual-bottom': Bind the document(s) with two staples (wire stitches) along the  
3056 bottom edge assuming a portrait document (see above).

3057 The 'staple-xxx' values are specified with respect to the document as if the document were a portrait  
3058 document. If the document is actually a landscape or a reverse-landscape document, the client supplies  
3059 the appropriate transformed value. For example, to position a staple in the upper left hand corner of a

3060 landscape document when held for reading, the client supplies the 'staple-bottom-left' value (since  
3061 landscape is defined as a +90 degree rotation from portrait, i.e., anti-clockwise). On the other hand, to  
3062 position a staple in the upper left hand corner of a reverse-landscape document when held for reading,  
3063 the client supplies the 'staple-top-right' value (since reverse-landscape is defined as a -90 degree rotation  
3064 from portrait, i.e., clockwise).

3065 The angle (vertical, horizontal, angled) of each staple with respect to the document depends on the  
3066 implementation which may in turn depend on the value of the attribute.

3067 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3068 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3069 attributes that control document processing is described in section 15.3.

3070 If the client supplies a value of 'none' along with any other combination of values, it is the same as if  
3071 only that other combination of values had been supplied (that is the 'none' value has no effect).

#### 3072 4.2.7 page-ranges (1setOf rangeOfInteger (1:MAX))

3073 This attribute identifies the range(s) of print-stream pages that the Printer object uses for each copy of  
3074 each document which are to be printed. Nothing is printed for any pages identified that do not exist in  
3075 the document(s). Ranges MUST be in ascending order, for example: 1-3, 5-7, 15-19 and MUST NOT  
3076 overlap, so that a non-spooling Printer object can process the job in a single pass. If the ranges are not  
3077 ascending or are overlapping, the IPP object MUST reject the request and return the 'client-error-bad-  
3078 request' status code. The attribute is associated with print-stream pages not application-numbered pages  
3079 (for example, the page numbers found in the headers and or footers for certain word processing  
3080 applications).

3081 For Jobs with multiple documents, the "multiple-document-handling" attribute determines what  
3082 constitutes a "copy" for purposes of the specified page range(s). When "multiple-document-handling" is  
3083 'single-document', the Printer object MUST apply each supplied page range once to the concatenation of  
3084 the print-stream pages. For example, if there are 8 documents of 10 pages each, the page-range '41:60'  
3085 prints the pages in the 5th and 6th documents as a single document and none of the pages of the other  
3086 documents are printed. When "multiple-document-handling" is 'separate-documents-uncollated-copies'  
3087 or 'separate-documents-collated-copies', the Printer object MUST apply each supplied page range  
3088 repeatedly to each document copy. For the same job, the page-range '1:3, 10:10' would print the first 3  
3089 pages and the 10th page of each of the 8 documents in the Job, as 8 separate documents.

3090 In most cases, the exact pages to be printed will be generated by a device driver and this attribute would  
3091 not be required. However, when printing an archived document which has already been formatted, the  
3092 end user may elect to print just a subset of the pages contained in the document. In this case, if page-  
3093 range = n.m is specified, the first page to be printed will be page n. All subsequent pages of the  
3094 document will be printed through and including page m.

3095 "page-ranges-supported" is a boolean value indicating whether or not the printer is capable of supporting  
3096 the printing of page ranges. This capability may differ from one PDL to another. There is no "page-

3097 ranges-default" attribute. If the "page-ranges" attribute is not supplied by the client, all pages of the  
3098 document will be printed.

3099 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3100 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3101 attributes that control document processing is described in section 15.3.

#### 3102 4.2.8 sides (type2 keyword)

3103 This attribute specifies how print-stream pages are to be imposed upon the sides of an instance of a  
3104 selected medium, i.e., an impression.

3105 The standard keyword values are:

3106 'one-sided': imposes each consecutive print-stream page upon the same side of consecutive media  
3107 sheets.

3108 'two-sided-long-edge': imposes each consecutive pair of print-stream pages upon front and back sides  
3109 of consecutive media sheets, such that the orientation of each pair of print-stream pages on the  
3110 medium would be correct for the reader as if for binding on the long edge. This imposition is  
3111 sometimes called 'duplex' or 'head-to-head'.

3112 'two-sided-short-edge': imposes each consecutive pair of print-stream pages upon front and back  
3113 sides of consecutive media sheets, such that the orientation of each pair of print-stream pages on  
3114 the medium would be correct for the reader as if for binding on the short edge. This imposition  
3115 is sometimes called 'tumble' or 'head-to-toe'.

3116

3117 'two-sided-long-edge', 'two-sided-short-edge', 'tumble', and 'duplex' all work the same for portrait or  
3118 landscape. However 'head-to-toe' is 'tumble' in portrait but 'duplex' in landscape. 'head-to-head' also  
3119 switches between 'duplex' and 'tumble' when using portrait and landscape modes.

3120 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3121 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3122 attributes that control document processing is described in section 15.3.

#### 3123 4.2.9 number-up (integer(1:MAX))

3124 This attribute specifies the number of print-stream pages to impose upon a single side of an instance of a  
3125 selected medium. For example, if the value is:

3126 Value	Description
3127 '1'	the Printer MUST place one print-stream page on a single side of an instance of the
3128	selected medium (MAY add some sort of translation, scaling, or rotation).
3129 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the
3130	selected medium (MAY add some sort of translation, scaling, or rotation).
3131 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the
3132	selected medium (MAY add some sort of translation, scaling, or rotation).
3133	

3134

3135 This attribute primarily controls the translation, scaling and rotation of print-stream pages.

3136 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3137 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3138 attributes that control document processing is described in section 15.3.

3139 4.2.10 orientation-requested (type2 enum)

3140 This attribute indicates the desired orientation for printed print-stream pages; it does not describe the  
3141 orientation of the client-supplied print-stream pages.

3142 For some document formats (such as 'application/postscript'), the desired orientation of the print-stream  
3143 pages is specified within the document data. This information is generated by a device driver prior to  
3144 the submission of the print job. Other document formats (such as 'text/plain') do not include the notion  
3145 of desired orientation within the document data. In the latter case it is possible for the Printer object to  
3146 bind the desired orientation to the document data after it has been submitted. It is expected that a Printer  
3147 object would only support "orientations-requested" for some document formats (e.g., 'text/plain' or  
3148 'text/html') but not others (e.g., 'application/postscript'). This is no different than any other Job Template  
3149 attribute since section 4.2, item 1, points out that a Printer object may support or not support any Job  
3150 Template attribute based on the document format supplied by the client. However, a special mention is  
3151 made here since it is very likely that a Printer object will support "orientation-requested" for only a  
3152 subset of the supported document formats.

3153 Standard enum values are:

3154	Value	Symbolic Name and Description
3155		
3156	'3'	'portrait': The content will be imaged across the short edge of the medium.
3157	'4'	'landscape': The content will be imaged across the long edge of the medium. Landscape 3158 is defined to be a rotation of the print-stream page to be imaged by +90 degrees 3159 with respect to the medium (i.e. anti-clockwise) from the portrait orientation. 3160 Note: The +90 direction was chosen because simple finishing on the long edge is 3161 the same edge whether portrait or landscape
3162	'5'	'reverse-landscape': The content will be imaged across the long edge of the medium. 3163 Reverse-landscape is defined to be a rotation of the print-stream page to be 3164 imaged by -90 degrees with respect to the medium (i.e. clockwise) from the 3165 portrait orientation. Note: The 'reverse-landscape' value was added because some 3166 applications rotate landscape -90 degrees from portrait, rather than +90 degrees.
3167	'6'	'reverse-portrait': The content will be imaged across the short edge of the medium. 3168 Reverse-portrait is defined to be a rotation of the print-stream page to be imaged 3169 by 180 degrees with respect to the medium from the portrait orientation. Note: 3170 The 'reverse-portrait' value was added for use with the "finishings" attribute in 3171 cases where the opposite edge is desired for finishing a portrait document on 3172 simple finishing devices that have only one finishing position. Thus a 'text/plain'

3173 portrait document can be stapled "on the right" by a simple finishing device as is  
3174 common use with some middle eastern languages such as Hebrew.  
3175

3176 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-  
3177 document-handling" job attribute (section 4.2.4) and the relationship of this attribute and the other  
3178 attributes that control document processing is described in section 15.3.

#### 3179 4.2.11 media (type3 keyword | name(MAX))

3180 This attribute identifies the medium that the Printer uses for all impressions of the Job.

3181 The values for "media" include medium-names, medium-sizes, input-trays and electronic forms so that  
3182 one attribute specifies the media. If a Printer object supports a medium name as a value of this attribute,  
3183 such a medium name implicitly selects an input-tray that contains the specified medium. If a Printer  
3184 object supports a medium size as a value of this attribute, such a medium size implicitly selects a  
3185 medium name that in turn implicitly selects an input-tray that contains the medium with the specified  
3186 size. If a Printer object supports an input-tray as the value of this attribute, such an input-tray implicitly  
3187 selects the medium that is in that input-tray at the time the job prints. This case includes manual-feed  
3188 input-trays. If a Printer object supports an electronic form as the value of this attribute, such an  
3189 electronic form implicitly selects a medium-name that in turn implicitly selects an input-tray that  
3190 contains the medium specified by the electronic form. The electronic form also implicitly selects an  
3191 image that the Printer MUST merge with the document data as its prints each page.

3192 Standard keyword values are (taken from ISO DPA and the Printer MIB) and are listed in section 14. An  
3193 administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on  
3194 implementation.

3195 There is also an additional Printer attribute named "media-ready" which differs from "media-supported"  
3196 in that legal values only include the subset of "media-supported" values that are physically loaded and  
3197 ready for printing with no operator intervention required. If an IPP object supports "media-supported", it  
3198 NEED NOT support "media-ready".

3199 The relationship of this attribute and the other attributes that control document processing is described in  
3200 section 15.3.

#### 3201 4.2.12 printer-resolution (resolution)

3202 This attribute identifies the resolution that Printer uses for the Job.

#### 3203 4.2.13 print-quality (type2 enum)

3204 This attribute specifies the print quality that the Printer uses for the Job.

3205 The standard enum values are:

3206 Value Symbolic Name and Description

3207

3208        '3'        'draft': lowest quality available on the printer

3209        '4'        'normal': normal or intermediate quality on the printer

3210        '5'        'high': highest quality available on the printer

3211

### 3212 4.3 Job Description Attributes

3213 The attributes in this section form the attribute group called "job-description". The following table  
3214 summarizes these attributes. The third column indicates whether the attribute is a REQUIRED attribute  
3215 that MUST be supported by Printer objects. If it is not indicated as REQUIRED, then it is OPTIONAL.  
3216 The maximum size in octets for 'text' and 'name' attributes is indicated in parentheses.

	Attribute	Syntax	REQUIRED?
3217			
3218			REQUIRED?
3219			
3220	job-uri	uri	REQUIRED
3221			
3222	job-id	integer(1:MAX)	REQUIRED
3223			
3224	job-printer-uri	uri	REQUIRED
3225			
3226	job-more-info	uri	
3227			
3228	job-name	name (MAX)	REQUIRED
3229			
3230	job-originating-user-name	name (MAX)	REQUIRED
3231			
3232	job-state	type1 enum	REQUIRED
3233			
3234	job-state-reasons	1setOf type2 keyword	<u>REQUIRED</u>
3235			
3236	job-state-message	text (MAX)	
3237			
3238	number-of-documents	integer (0:MAX)	
3239			
3240	output-device-assigned	name (127)	
3241			
3242	time-at-creation	integer (0:MAX)	<u>REQUIRED</u>
3243			
3244	time-at-processing	integer (0:MAX)	<u>REQUIRED</u>
3245			
3246	time-at-completed	integer (0:MAX)	<u>REQUIRED</u>
3247			
3248	<u>job-printer-up-time</u>	<u>integer (1:MAX)</u>	<u>REQUIRED</u>
3249			
3250	number-of-intervening-jobs	integer (0:MAX)	
3251			
3252	job-message-from-operator	text (127)	
3253			
3254	job-k-octets	integer (0:MAX)	
3255			
3256	job-impressions	integer (0:MAX)	
3257			
3258	job-media-sheets	integer (0:MAX)	
3259			
3260	job-k-octets-processed	integer (0:MAX)	
3261			
3262	job-impressions-completed	integer (0:MAX)	
3263			
3264	job-media-sheets-completed	integer (0:MAX)	
3265			
3266	attributes-charset	charset	REQUIRED

3267	+-----+-----+-----+
3268	attributes-natural-language   naturalLanguage   REQUIRED
3269	+-----+-----+-----+
3270	
3271	

3272 4.3.1 job-uri (uri)

3273 This REQUIRED attribute contains the URI for the job. The Printer object, on receipt of a new job,  
3274 generates a URI which identifies the new Job. The Printer object returns the value of the "job-uri"  
3275 attribute as part of the response to a create request. The precise format of a Job URI is implementation  
3276 dependent. If the Printer object supports more than one URI and there is some relationship between the  
3277 newly formed Job URI and the Printer object's URI, the Printer object uses the Printer URI supplied by  
3278 the client in the create request. For example, if the create request comes in over a secure channel, the  
3279 new Job URI MUST use the same secure channel. This can be guaranteed because the Printer object is  
3280 responsible for generating the Job URI and the Printer object is aware of its security configuration and  
3281 policy as well as the Printer URI used in the create request.

3282 For a description of this attribute and its relationship to "job-id" and "job-printer-uri" attribute, see the  
3283 discussion in section 2.4 on "Object Identity".

3284 4.3.2 job-id (integer(1:MAX))

3285 This REQUIRED attribute contains the ID of the job. The Printer, on receipt of a new job, generates an  
3286 ID which identifies the new Job on that Printer. The Printer returns the value of the "job-id" attribute as  
3287 part of the response to a create request. The 0 value is not included to allow for compatibility with  
3288 SNMP index values which also cannot be 0.

3289 For a description of this attribute and its relationship to "job-uri" and "job-printer-uri" attribute, see the  
3290 discussion in section 2.4 on "Object Identity".

3291 4.3.3 job-printer-uri (uri)

3292 This REQUIRED attribute identifies the Printer object that created this Job object. When a Printer  
3293 object creates a Job object, it populates this attribute with the Printer object URI that was used in the  
3294 create request. This attribute permits a client to identify the Printer object that created this Job object  
3295 when only the Job object's URI is available to the client. The client queries the creating Printer object to  
3296 determine which languages, charsets, operations, are supported for this Job.

3297 For a description of this attribute and its relationship to "job-uri" and "job-id" attribute, see the  
3298 discussion in section 2.4 on "Object Identity".

3299 4.3.4 job-more-info (uri)

3300 Similar to "printer-more-info", this attribute contains the URI referencing some resource with more  
3301 information about this Job object, perhaps an HTML page containing information about the Job.

3302 4.3.5 job-name (name(MAX))

3303 This REQUIRED attribute is the name of the job. It is a name that is more user friendly than the "job-  
3304 uri" attribute value. It does not need to be unique between Jobs. The Job's "job-name" attribute is set to  
3305 the value supplied by the client in the "job-name" operation attribute in the create request (see Section  
3306 3.2.1.1). If, however, the "job-name" operation attribute is not supplied by the client in the create  
3307 request, the Printer object, on creation of the Job, MUST generate a name. The printer SHOULD  
3308 generate the value of the Job's "job-name" attribute from the first of the following sources that produces  
3309 a value: 1) the "document-name" operation attribute of the first (or only) document, 2) the "document-  
3310 URI" attribute of the first (or only) document, or 3) any other piece of Job specific and/or Document  
3311 Content information.

3312 4.3.6 job-originating-user-name (name(MAX))

3313 This REQUIRED attribute contains the name of the end user that submitted the print job. The Printer  
3314 object sets this attribute to the most authenticated printable name that it can obtain from the  
3315 authentication service over which the IPP operation was received. Only if such is not available, does the  
3316 Printer object use the value supplied by the client in the "requesting-user-name" operation attribute of the  
3317 create operation (see Section 8).

3318 Note: The Printer object needs to keep an internal originating user id of some form, typically as a  
3319 credential of a principal, with the Job object. Since such an internal attribute is implementation-  
3320 dependent and not of interest to clients, it is not specified as a Job Description attribute. This originating  
3321 user id is used for authorization checks (if any) on all subsequent operation.

3322 4.3.7 job-state (type1 enum)

3323 This REQUIRED attribute identifies the current state of the job. Even though the IPP protocol defines  
3324 ~~eight~~seven values for job states (plus the out-of-band 'unknown' value - see Section 4.1),  
3325 implementations only need to support those states which are appropriate for the particular  
3326 implementation. In other words, a Printer supports only those job states implemented by the output  
3327 device and available to the Printer object implementation.

3328 Standard enum values are:

3329	Values	Symbolic Name and Description
3330		
3331	'3'	'pending': The job is a candidate to start processing, but is not yet processing.
3332		
3333	'4'	'pending-held': The job is not a candidate for processing for any number of reasons but 3334 will return to the 'pending' state as soon as the reasons are no longer present. The 3335 job's "job-state-reason" attribute MUST indicate why the job is no longer a 3336 candidate for processing.
3337		
3338	'5'	'processing': One or more of:
3339		

- 3340 1. the job is using, or is attempting to use, one or more purely software processes  
3341 that are analyzing, creating, or interpreting a PDL, etc.,  
3342 2. the job is using, or is attempting to use, one or more hardware devices that are  
3343 interpreting a PDL, making marks on a medium, and/or performing finishing,  
3344 such as stapling, etc.,  
3345 3. the Printer object has made the job ready for printing, but the output device is  
3346 not yet printing it, either because the job hasn't reached the output device or  
3347 because the job is queued in the output device or some other spooler, awaiting the  
3348 output device to print it.  
3349

3350 When the job is in the 'processing' state, the entire job state includes the detailed  
3351 status represented in the ~~printer's~~ Printer object's "printer-state", "printer-state-  
3352 reasons", and "printer-state-message" attributes.

3353 Implementations MAY, though they NEED NOT, include additional values in the  
3354 job's "job-state-reasons" attribute to indicate the progress of the job, such as  
3355 adding the 'job-printing' value to indicate when the output device is actually  
3356 making marks on paper and/or the 'processing-to-stop-point' value to indicate that  
3357 the IPP object is in the process of canceling or aborting the job. Most  
3358 implementations won't bother with this nuance.  
3359

3360 '6' 'processing-stopped': The job has stopped while processing for any number of reasons  
3361 and will return to the 'processing' state as soon as the reasons are no longer  
3362 present.  
3363

3364 The job's "job-state-reason" attribute MAY indicate why the job has stopped  
3365 processing. For example, if the output device is stopped, the 'printer-stopped'  
3366 value MAY be included in the job's "job-state-reasons" attribute.  
3367

3368 Note: When an output device is stopped, the device usually indicates its condition  
3369 in human readable form locally at the device. A client can obtain more complete  
3370 device status remotely by querying the Printer object's "printer-state", "printer-  
3371 state-reasons" and "printer-state-message" attributes.  
3372

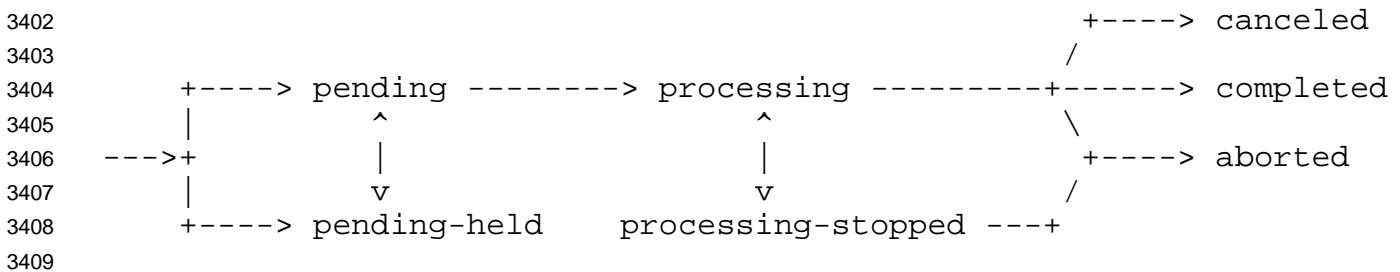

3373 '7' 'canceled': The job has been canceled by a Cancel-Job operation and the Printer object  
3374 has completed canceling the job and all job status attributes have reached their  
3375 final values for the job. While the Printer object is canceling the job, the job  
3376 remains in its current state, but the job's "job-state-reasons" attribute SHOULD  
3377 contain the 'processing-to-stop-point' value and one of the 'canceled-by-user',  
3378 'canceled-by-operator', or 'canceled-at-device' value. When the job moves to the  
3379 'canceled' state, the 'processing-to-stop-point' value, if present, MUST be  
3380 removed, but the 'canceled-by-xxx', if present, MUST remain.  
3381

3382 '8' 'aborted': The job has been aborted by the system, usually while the job was in the  
3383 'processing' or 'processing-stopped' state and the Printer has completed aborting  
3384 the job and all job status attributes have reached their final values for the job.  
3385 While the Printer object is aborting the job, the job remains in its current state, but  
3386 the job's "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-  
3387 point' and 'aborted-by-system' values. When the job moves to the 'aborted' state,  
3388 the 'processing-to-stop-point' value, if present, MUST be removed, but the  
3389 'aborted-by-system' value, if present, MUST remain.

3391 '9' 'completed': The job has completed successfully or with warnings or errors after  
3392 processing and all of the job media sheets have been successfully stacked in the  
3393 appropriate output bin(s) and all job status attributes have reached their final  
3394 values for the job. The job's "job-state-reasons" attribute SHOULD contain one  
3395 of: 'completed-successfully', 'completed-with-warnings', or 'completed-with-errors'  
3396 values.

3398 The final value for this attribute MUST be one of: 'completed', 'canceled', or 'aborted' before the Printer  
3399 removes the job altogether. The length of time that jobs remain in the 'canceled', 'aborted', and  
3400 'completed' states depends on implementation. See section 4.3.7.1.

3401 The following figure shows the normal job state transitions.

3410 Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden.  
3411 Not shown are the transitions to the 'canceled' state from the 'pending', 'pending-held', and 'processing-  
3412 stopped' states.

3413 Jobs reach one of the three terminal states: 'completed', 'canceled', or 'aborted', after the jobs have  
3414 completed all activity, including stacking output media, after the jobs have completed all activity, and all  
3415 job status attributes have reached their final values for the job.

3416 Note: As with all other IPP attributes, if the implementation can-not determine the correct value for this  
3417 attribute, it SHOULD respond with the out-of-band value 'unknown' (see section 4.1) rather than try to  
3418 guess at some possibly incorrect value and give the end user the wrong impression about the state of the  
3419 Job object. For example, if the implementation is just a gateway into some printing system that does not  
3420 provide from which it can normally get status, but temporarily is unable, then the implementation should  
3421 return the 'unknown' value. However, if the implementation is a gateway to a printing system that never  
3422 provides detailed status about the print job, the implementation MAY set the IPP Job object's state

3423 might literally be 'unknown' to 'completed', provided that it also sets the 'queued-in-device' value in the  
3424 job's "job-state-reasons" attribute (see section 4.3.8). **Issue 14**

#### 3425 4.3.7.1 Partitioning of Job States

3426 This section partitions the 7 job states into phases: Job Not Completed, Job Retention, Job History, and  
3427 Job Removal. This section also explains the 'job-restartable' value of the "job-state-reasons" Job  
3428 Description attribute for use with the Restart-Job operation.

3429 Job Not Completed: When a job is in the 'pending', 'pending-held', 'processing', or 'processing-stopped'  
3430 states, the job is not completed.

3431 Job Retention: When a job enters one of the three terminal job states: 'completed', 'canceled', or  
3432 'aborted', the IPP Printer object MAY "retain" the job in a restartable condition for an implementation-  
3433 defined time period. This time period MAY be zero seconds and MAY depend on the terminal job state.  
3434 This phase is called Job Retention. While in the Job Retention phase, the job's document data is retained  
3435 and a client may restart the job using the Restart-Job operation. If the IPP object supports **Issue 30** the  
3436 Restart-Job operation, then it SHOULD indicate that the job is restartable by adding the 'job-restartable'  
3437 value to the job's "job-state-reasons" attribute (see Section 4.3.8) during the Job Retention phase.

3438 Job History: After the Job Retention phase expires for a job, the Printer object deletes the document  
3439 data for the job and the job becomes part of the Job History. The Printer object MAY also delete any  
3440 number of the job attributes. Since the job is no longer restartable, the Printer object MUST remove the  
3441 'job-restartable' value from the job's "job-state-reasons" attribute, if present.

3442 Job Removal: After the job has remained in the Job History for an implementation-defined time, such as  
3443 when the number of jobs exceeds a fixed number or after a fixed time period (which MAY be zero  
3444 seconds), the IPP Printer removes the job from the system.

3445 Using the Get-Jobs operation and supplying the 'not-completed' value for the "which-jobs" operation  
3446 attribute, a client is requesting jobs in the Job Not Completed phase. Using the Get-Jobs operation and  
3447 supplying the 'completed' value for the "which-jobs" operation attribute, a client is requesting jobs in the  
3448 Job Retention and Job History phases. Using the Get-Job-Attributes operation, a client is requesting a  
3449 job in any phase except Job Removal. After Job Removal, the Get-Job-Attributes and Get-Jobs  
3450 operations no longer are capable of returning any information about a job.

#### 3451 4.3.8 job-state-reasons (1setOf type2 keyword)

3452 This **REQUIRED** attribute provides additional information about the job's current state, i.e., information  
3453 that augments the value of the job's "job-state" attribute.

3454 Implementation ~~While implementation of this attribute is REQUIRED, implementation~~ of these values is  
3455 ~~OPTIONAL, i.e., a Printer NEED NOT implement them, even if (1) the output device supports the~~  
3456 ~~functionality represented by the reason and (2) is available to the Printer object~~  
3457 ~~implementation.~~ **OPTIONAL.** **Issue 30** These values MAY be used with any job state or states for  
3458 which the reason makes sense. Furthermore, when implemented, the Printer MUST return these values  
3459 when the reason applies and MUST NOT return them when the reason no longer applies whether the

3460 value of the Job's "job-state" attribute changed or not. When the Job does not have any reasons for being  
3461 in its current state, the value of the Job's ~~"job-state"~~ "job-state-reasons" attribute MUST be 'none'.

3462 Note: While values cannot be added to the 'job-state' attribute without impacting deployed clients that  
3463 take actions upon receiving "job-state" values, it is the intent that additional "job-state-reasons" values  
3464 can be defined and registered without impacting such deployed clients. In other words, the "job-state-  
3465 reasons" attribute is intended to be extensible.

3466 The following standard keyword values are defined. For ease of understanding, the values are presented  
3467 in the order in which the reasons are likely to occur (if implemented), starting with the 'job-incoming'  
3468 value:

3469 'none': There are no reasons for the job's current state. This state reason is semantically equivalent  
3470 to "job-state-reasons" without any value and MUST be used when there is no other value, since  
3471 the 1setOf attribute syntax requires at least one value.

3472 'job-incoming': The Create-Job operation has been accepted by the Printer, but the Printer is  
3473 expecting additional Send-Document and/or Send-URI operations and/or is accessing/accepting  
3474 document data.

3475 'job-data-insufficient': The Create-Job operation has been accepted by the Printer, but the Printer is  
3476 expecting additional document data before it can move the job into the 'processing' state. If a  
3477 Printer starts processing before it has received all data, the Printer removes the 'job-data-  
3478 insufficient' reason, but the 'job-incoming' remains. If a Printer starts processing after it has  
3479 received all data, the Printer removes the 'job-data-insufficient' reason and the 'job-incoming' at  
3480 the same time. Issue 13

3481 'document-access-error': After accepting a Print-URI or Send-URI request, the Printer could not  
3482 access one or more documents passed by reference. This reason is intended to cover any file  
3483 access problem, including file does not exist and access denied because of an access control  
3484 problem. Whether the Printer aborts the job and moves the job to the 'aborted' job state or prints  
3485 all documents that are accessible and moves the job to the 'completed' job state and adds the  
3486 'completed-with-errors' value in the job's "job-state-reasons" attribute depends on implementation  
3487 and/or site policy. Issue 35

3488 'submission-interrupted': The job was not completely submitted for some unforeseen reason, such  
3489 as: (1) the Printer has crashed before the job was closed by the client, (2) the Printer or the  
3490 document transfer method has crashed in some non-recoverable way before the document data  
3491 was entirely transferred to the Printer, (3) the client crashed or failed to close the job before the  
3492 time-out period. See section 4.4.31.

3493 'job-outgoing': The Printer is transmitting the job to the output device.

3494 'job-hold-until-specified': The value of the job's "job-hold-until" attribute was specified with a time  
3495 period that is still in the future. The job MUST NOT be a candidate for processing until this  
3496 reason is removed and there are no other reasons to hold the job.

3497 'resources-are-not-ready': At least one of the resources needed by the job, such as media, fonts,  
3498 resource objects, etc., is not ready on any of the physical printer's for which the job is a candidate.  
3499 This condition MAY be detected when the job is accepted, or subsequently while the job is  
3500 pending or processing, depending on implementation. The job may remain in its current state or  
3501 be moved to the 'pending-held' state, depending on implementation and/or job scheduling policy.

- 3502 'printer-stopped-partly': The value of the Printer's "printer-state-reasons" attribute contains the value  
3503 'stopped-partly'.
- 3504 'printer-stopped': The value of the Printer's "printer-state" attribute is 'stopped'.
- 3505 'job-interpreting': Job is in the 'processing' state, but more specifically, the Printer is interpreting the  
3506 document data.
- 3507 'job-queued': Job is in the 'processing' state, but more specifically, the Printer has queued the  
3508 document data.
- 3509 'job-transforming': Job is in the 'processing' state, but more specifically, the Printer is interpreting  
3510 document data and producing another electronic representation.
- 3511 'job-queued-for-marker': Job is in any of the 'pending-held', 'pending', or 'processing' states, but more  
3512 specifically, the Printer has completed enough processing of the document to be able to start  
3513 marking and the job is waiting for the marker. Systems that require human intervention to  
3514 release jobs using the Release-Job operation, put the job into the 'pending-held' job state.  
3515 Systems that automatically select a job to use the marker put the job into the 'pending' job state  
3516 or keep the job in the 'processing' job state while waiting for the marker, depending on  
3517 implementation. All implementations put the job into (or back into) the 'processing' state when  
3518 marking does begin. Issue 3!
- 3519 'job-printing': The output device is marking media. This value is useful for Printers which spend a  
3520 great deal of time processing (1) when no marking is happening and then want to show that  
3521 marking is now happening or (2) when the job is in the process of being canceled or aborted  
3522 while the job remains in the 'processing' state, but the marking has not yet stopped so that  
3523 impression or sheet counts are still increasing for the job.
- 3524 'job-canceled-by-user': The job was canceled by the owner of the job using the Cancel-Job request,  
3525 i.e., by a user whose authenticated identity is the same as the value of the originating user that  
3526 created the Job object, or by some other authorized end-user, such as a member of the job  
3527 owner's security group.
- 3528 'job-canceled-by-operator': The job was canceled by the operator using the Cancel-Job request, i.e.,  
3529 by a user who has been authenticated as having operator privileges (whether local or remote). If  
3530 the security policy is to allow anyone to cancel anyone's job, then this value may be used when  
3531 the job is canceled by other than the owner of the job. For such a security policy, in effect,  
3532 everyone is an operator as far as canceling jobs with IPP is concerned.
- 3533 'job-canceled-at-device': The job was canceled by an unidentified local user, i.e., a user at a console  
3534 at the device.
- 3535 'aborted-by-system': The job (1) is in the process of being aborted, (2) has been aborted by the  
3536 system and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the  
3537 'pending-held' state, so that a user or operator can manually try the job again.
- 3538 'unsupported-compression': The job was aborted by the system because the Printer determined while  
3539 attempting to decompress the document-data's that the compression is actually not among those  
3540 supported by the Printer. Issue 6
- 3541 'compression-error': The job was aborted by the system because the Printer encountered an error in  
3542 the document-data while decompressing it. If the Printer posts this reason, the document-data has  
3543 already passed any tests that would have led to the 'unsupported-compression' job-state-reason.  
3544 Issue 6
- 3545 'unsupported-document-format': The job was aborted by the system because the document-data's  
3546 document-format is not among those supported by the Printer. If the client specifies the

3547 document-format as 'application/octet-stream', the printer MAY abort the job and post this reason  
3548 even though the format is a member of the "document-format-supported" printer attribute, but  
3549 not among the auto-sensed document-formats. Issue 3  
3550 'document-format-error': The job was aborted by the system because the Printer encountered an error  
3551 in the document-data while processing it. If the Printer posts this reason, the document-data has  
3552 already passed any tests that would have led to the 'unsupported-document-format' job-state-  
3553 reason. Issue 3  
3554 'processing-to-stop-point': The requester has issued a ~~Cancel-job~~ Cancel-Job operation or the Printer  
3555 object has aborted the job, but is still performing some actions on the job until a specified stop  
3556 point occurs or job termination/cleanup is completed.

3558 This reason is recommended to be used in conjunction with the 'processing' job state to indicate  
3559 that the Printer object is still performing some actions on the job while the job remains in the  
3560 'processing' state. After all the job's job description attributes have stopped incrementing, the  
3561 Printer object moves the job from the 'processing' state to the 'canceled' or 'aborted' job states.

3562  
3563 'service-off-line': The Printer is off-line and accepting no jobs. All 'pending' jobs are put into the  
3564 'pending-held' state. This situation could be true if the service's or document transform's input is  
3565 impaired or broken.

3566 'job-completed-successfully': The job completed successfully.

3567 'job-completed-with-warnings': The job completed with warnings.

3568 'job-completed-with-errors': The job completed with errors (and possibly warnings too).

3569 'job-restartable' - This job is retained (see section 4.3.7.1) and is currently able to be restarted using  
3570 the Restart-Job operation (see section 3.3.7). If 'job-restartable' is a value of the job's 'job-state-  
3571 reasons' attribute, then the IPP object MUST accept a Restart-Job operation for that job.

3572 'queued-in-device': The job has been forwarded to a device or print system that is unable to send  
3573 back status. The Printer sets the job's "job-state" attribute to 'completed' and adds the 'queued-  
3574 in-device' value to the job's "job-state-reasons" attribute to indicate that the Printer has no  
3575 additional information about the job and never will have any better information. See note in  
3576 section 4.3.7. Issue 14

#### 3577 4.3.9 job-state-message (text(MAX))

3578 This attribute specifies information about the "job-state" and "job-state-reasons" attributes in human  
3579 readable text. If the Printer object supports this attribute, the Printer object MUST be able to generate  
3580 this message in any of the natural languages identified by the Printer's "generated-natural-language-  
3581 supported" attribute (see the "attributes-natural-language" operation attribute specified in Section  
3582 3.1.4.1).

3583 Note: the value SHOULD NOT contain additional information not contained in the values of the "job-  
3584 state" and "job-states-reasons" attributes, such as interpreter error information. Otherwise, application  
3585 programs might attempt to parse the (localized text). For such additional information such as interpreter  
3586 errors for application program ~~consumption, a new attribute~~ consumption or specific document access  
3587 errors, new attributes with keyword values, needs to be developed and registered.

3588 4.3.10 number-of-documents (integer(0:MAX))

3589 This attribute indicates the number of documents in the job, i.e., the number of Send-Document, Send-  
3590 URI, Print-Job, or Print-URI operations that the Printer has accepted for this job, regardless of whether  
3591 the document data has reached the Printer object or not.

3592 Implementations supporting the OPTIONAL Create-Job/Send-Document/Send-URI operations  
3593 SHOULD support this attribute so that clients can query the number of documents in each job.

3594 4.3.11 output-device-assigned (name(127))

3595 This attribute identifies the output device to which the Printer object has assigned this job. If an output  
3596 device implements an embedded Printer object, the Printer object NEED NOT set this attribute. If a  
3597 print server implements a Printer object, the value MAY be empty (zero-length string) or not returned  
3598 until the Printer object assigns an output device to the job. This attribute is particularly useful when a  
3599 single Printer object support multiple devices (so called "fan-out").

3600 4.3.12 Event Time Job Description Attributes Issue 17

3601 This section defines the Job Description attributes that indicate the time at which certain events occur for  
3602 a job. The attribute syntax MUST be either 'integer' or 'dateTime' for any response in which the  
3603 "version-number" parameter is supplied as '1.1', but MUST be an 'integer' for any response in which the  
3604 "version-number" parameter is supplied as '1.0', for compatibility with IPP/1.0 [RFC2566]. See section  
3605 3.1.8.

3606 In order to populate these Event Time Job Description Attributes, the Printer object copies either:

- 3607 1. the value in its "printer-current-time" attribute for the 'dateTime' value at the time the event  
3608 occurred if the printer supports the attribute "printer-current-time" and its value is not the out-  
3609 of-band 'no-value' value,
- 3610 2. the value in its "printer-up-time" attribute for the 'integer' value at the time the event occurred  
3611 otherwise

3612 Note: because the time MAY become known to the Printer some time after power-up, a client could  
3613 receive jobs that contain some Event Time Job Description Attributes that use the 'integer' time tick  
3614 representation while the later events use the 'dateTime' date/time representation.

3615 If the Printer implementation keeps jobs persistently across power cycles, then an implementation  
3616 MUST reset its "printer-up-time" attribute to 1 on each power-up. In addition, an implementation that  
3617 uses the 'integer' form MUST change all of its Event Time Job Description attributes for those persistent  
3618 jobs either:

- 3619 1. to 0 to indicate that the event happened before the most recent power up

3620 2. to the negative of the number of seconds before the most recent power-up that the event took  
3621 place, though the negative number NEED NOT reflect the exact number of seconds

3622 An implementation that uses the 'dateTime' form does not change the values of any of its Event Time  
3623 Job Description Attributes for persistent jobs on power-up.

3624 ~~4.3.124.3.12.1~~ 4.3.12.1 time-at-creation (integer(0:MAX))(integer(MIN:MAX) | dateTime)

3625 This **REQUIRED** attribute indicates the point in time at which the Job object was created. ~~In order to~~  
3626 ~~populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the~~  
3627 ~~Job object is created.~~

3628 ~~4.3.134.3.12.2~~ 4.3.12.2 time-at-processing (integer(0:MAX))(integer(MIN:MAX) | dateTime)

3629 This **REQUIRED** attribute indicates the point in time at which the Job object began processing. ~~In order~~  
3630 ~~to populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the~~  
3631 ~~Job object is moved into~~ The out-of-band 'no-value' value is returned if the job has not yet been in the  
3632 'processing' state for the first time. (see the beginning of Section 4.1)..

3633 ~~4.3.144.3.12.3~~ 4.3.12.3 time-at-completed (integer(0:MAX))(integer(MIN:MAX) | dateTime)

3634 This **REQUIRED** attribute indicates the point in time at which the Job object completed (or was  
3635 cancelled or aborted). The out-of-band 'no-value' value is returned if the job has not yet completed, been  
3636 canceled, or aborted (see the beginning of Section 4.1).

3637 4.3.12.4 job-printer-up-time (integer(1:MAX)) **Issue 17**

3638 ~~In order to populate this attribute, the Printer object uses the value in its~~ This **REQUIRED** Job  
3639 Description attribute indicates the amount of time (in seconds) that the Printer implementation has been  
3640 up and running. This attribute is an alias for the "printer-up-time" Printer Description attribute (see  
3641 Section 4.4.29).

3642 Note: A client MAY request this attribute in a Get-Job-Attributes or Get-Jobs request and use the value  
3643 returned in combination with other requested Event Time Job Description Attributes in order to display  
3644 time attributes to a user when the IPP Printer returns them using the 'integer' attribute syntax. The  
3645 difference between this attribute at the time the Job object is moved into the 'completed' or 'canceled' or  
3646 'aborted' state and the 'integer' value of a "time-at-xxx" attribute is the number of seconds ago that the  
3647 "time-at-xxx" event occurred. A client can compute the wall-clock time at which the "time-at-xxx" event  
3648 occurred by subtracting this difference from the client's wall-clock time.

3649 4.3.13 number-of-intervening-jobs (integer(0:MAX))

3650 This attribute indicates the number of jobs that are "ahead" of this job in the relative chronological order  
3651 of expected time to complete (i.e., the current scheduled order). For efficiency, it is only necessary to  
3652 calculate this value when an operation is performed that requests this attribute.

3653 4.3.14 job-message-from-operator (text(127))

3654 This attribute provides a message from an operator, system administrator or "intelligent" process to  
3655 indicate to the end user the reasons for modification or other management action taken on a job.

3656 4.3.15 Job Size Attributes

3657 This sub-section defines job attributes that describe the size of the job. These attributes are not intended  
3658 to be counters; they are intended to be useful routing and scheduling information if known. For these  
3659 attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even  
3660 if the client does supply a value for these three attributes in the create request, the Printer object MAY  
3661 choose to change the value if the Printer object is able to compute a value which is more accurate than  
3662 the client supplied value. The Printer object may be able to determine the correct value for these  
3663 attributes either right at job submission time or at any later point in time.

3664 4.3.15.1 job-k-octets (integer(0:MAX))

3665 This attribute specifies the total size of the document(s) in K octets, i.e., in units of 1024 octets requested  
3666 to be processed in the job. The value MUST be rounded up, so that a job between 1 and 1024 octets  
3667 MUST be indicated as being 1, 1025 to 2048 MUST be 2, etc.

3668 This value MUST NOT include the multiplicative factors contributed by the number of copies specified  
3669 by the "copies" attribute, independent of whether the device can process multiple copies without making  
3670 multiple passes over the job or document data and independent of whether the output is collated or not.  
3671 Thus the value is independent of the implementation and indicates the size of the document(s) measured  
3672 in K octets independent of the number of copies.

3673 This value MUST also not include the multiplicative factor due to a copies instruction embedded in the  
3674 document data. If the document data actually includes replications of the document data, this value will  
3675 include such replication. In other words, this value is always the size of the source document data, rather  
3676 than a measure of the hardcopy output to be produced.

3677 ~~Note: This attribute and the following two attributes ("job-impressions" and "job-media-sheets") are not~~  
3678 ~~intended to be counters; they are intended to be useful routing and scheduling information if known. For~~  
3679 ~~these three attributes, the Printer object may try to compute the value if it is not supplied in the create~~  
3680 ~~request. Even if the client does supply a value for these three attributes in the create request, the Printer~~  
3681 ~~object MAY choose to change the value if the Printer object is able to compute a value which is more~~  
3682 ~~accurate than the client supplied value. The Printer object may be able to determine the correct value for~~  
3683 ~~these three attributes either right at job submission time or at any later point in time.~~

3684 4.3.15.2 job-impressions (integer(0:MAX))

3685 This attribute specifies the total size in number of impressions of the document(s) being submitted (see  
3686 the definition of impression in section 12.2.5).

3687 As with "job-k-octets", this value MUST NOT include the multiplicative factors contributed by the  
3688 number of copies specified by the "copies" attribute, independent of whether the device can process  
3689 multiple copies without making multiple passes over the job or document data and independent of  
3690 whether the output is collated or not. Thus the value is independent of the implementation and reflects  
3691 the size of the document(s) measured in impressions independent of the number of copies.

3692 As with "job-k-octets", this value MUST also not include the multiplicative factor due to a copies  
3693 instruction embedded in the document data. If the document data actually includes replications of the  
3694 document data, this value will include such replication. In other words, this value is always the number  
3695 of impressions in the source document data, rather than a measure of the number of impressions to be  
3696 produced by the job.

3697 ~~See the Note in the "job-k-octets" attribute that also applies to this attribute.~~

#### 3698 4.3.15.3 job-media-sheets (integer(0:MAX))

3699 This attribute specifies the total number of media sheets to be produced for this job.

3700 Unlike the "job-k-octets" and the "job-impressions" attributes, this value MUST include the  
3701 multiplicative factors contributed by the number of copies specified by the "copies" attribute and a  
3702 'number of copies' instruction embedded in the document data, if any. This difference allows the system  
3703 administrator to control the lower and upper bounds of both (1) the size of the document(s) with "job-k-  
3704 octets-supported" and "job-impressions-supported" and (2) the size of the job with "job-media-sheets-  
3705 supported".

3706 ~~See the Note in the "job-k-octets" attribute that also applies to this attribute.~~

#### 3707 4.3.16 Job Progress Attributes

3708 This sub-section defines job attributes that describe the progress of the job. These attributes are intended  
3709 to be counters. That is, the value for a job that has not started processing MUST be 0. When the job's  
3710 "job-state" is 'processing' or 'processing-stopped', this value is intended to contain the amount of the job  
3711 that has been processed to the time at which the attributes are requested. When the job enters the  
3712 'completed', 'canceled', or 'aborted' states, these values are the final values for the job.

#### 3713 4.3.16.1 job-k-octets-processed (integer(0:MAX))

3714 This attribute specifies the total number of octets processed in K octets, i.e., in units of 1024 octets so  
3715 far. The value MUST be rounded up, so that a job between 1 and 1024 octets inclusive MUST be  
3716 indicated as being 1, 1025 to 2048 inclusive MUST be 2, etc.

3717 For implementations where multiple copies are produced by the interpreter with only a single pass over  
3718 the data, the final value MUST be equal to the value of the "job-k-octets" attribute. For implementations  
3719 where multiple copies are produced by the interpreter by processing the data for each copy, the final  
3720 value MUST be a multiple of the value of the "job-k-octets" attribute.

3721 ~~Note: This attribute and the following two attributes ("job-impressions-completed" and "job-sheets-~~  
3722 ~~completed") are intended to be counters. That is, the value for a job that has not started processing~~  
3723 ~~MUST be 0. When the job's "job-state" is 'processing' or 'processing-stopped', this value is intended to~~  
3724 ~~contain the amount of the job that has been processed to the time at which the attributes are requested.~~

#### 3725 4.3.16.2 job-impressions-completed (integer(0:MAX))

3726 This job attribute specifies the number of impressions completed for the job so far. For printing devices,  
3727 the impressions completed includes interpreting, marking, and stacking the output.

3728 ~~See the note in "job-k-octets-processed" which also applies to this attribute.~~

#### 3729 4.3.16.3 job-media-sheets-completed (integer(0:MAX))

3730 This job attribute specifies the media-sheets completed marking and stacking for the entire job so far  
3731 whether those sheets have been processed on one side or on both.

3732 ~~See the note in "job-k-octets-processed" which also applies to this attribute.~~

#### 3733 4.3.17 attributes-charset (charset)

3734 This REQUIRED attribute is populated using the value in the client supplied "attributes-charset"  
3735 attribute in the create request. It identifies the charset (coded character set and encoding method) used  
3736 by any Job attributes with attribute syntax 'text' and 'name' that were supplied by the client in the create  
3737 request. See Section 3.1.4 for a complete description of the "attributes-charset" operation attribute.

3738 This attribute does not indicate the charset in which the 'text' and 'name' values are stored internally in  
3739 the Job object. The internal charset is implementation-defined. The IPP object MUST convert from  
3740 whatever the internal charset is to that being requested in an operation as specified in Section 3.1.4.

#### 3741 4.3.18 attributes-natural-language (naturalLanguage)

3742 This REQUIRED attribute is populated using the value in the client supplied "attributes-natural-  
3743 language" attribute in the create request. It identifies the natural language used for any Job attributes  
3744 with attribute syntax 'text' and 'name' that were supplied by the client in the create request. See Section  
3745 3.1.4 for a complete description of the "attributes-natural-language" operation attribute. See Sections  
3746 4.1.1.2 and 4.1.2.2 for how a Natural Language Override may be supplied explicitly for each 'text' and  
3747 'name' attribute value that differs from the value identified by the "attributes-natural-language" attribute.

### 3748 4.4 Printer Description Attributes

3749 These attributes form the attribute group called "printer-description". The following table summarizes  
3750 these attributes, their syntax, and whether or not they are REQUIRED for a Printer object to support. If  
3751 they are not indicated as REQUIRED, they are OPTIONAL. The maximum size in octets for 'text' and  
3752 'name' attributes is indicated in parentheses.

3753 Note: How these attributes are set by an Administrator is outside the scope of this ~~specification.~~ IPP/1.1  
3754 document.

3755	+-----+-----+-----+-----+

3838			

3839 4.4.1 printer-uri-supported (1setOf uri)

3840 This REQUIRED Printer attribute contains at least one URI for the Printer object. It OPTIONALLY  
 3841 contains more than one URI for the Printer object. An administrator determines a Printer object's  
 3842 URI(s) and configures this attribute to contain those URIs by some means outside the scope of  
 3843 ~~IPP/1.0~~ this IPP/1.1 document. The precise format of this URI is implementation dependent and  
 3844 depends on the protocol. See the next ~~section~~ two sections for a description of the "uri-security-  
 3845 supported" and "uri-authentication-supported" attributes, both of which isare the REQUIRED  
 3846 companion attributes to this "printer-uri-supported" attribute. See section 2.4 on Printer object identity  
 3847 and section 8.2 on security and URIs for more information.

3848 4.4.2 uri-authentication-supported (1setOf type2 keyword) **Issue 2**

3849 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values)  
3850 as the "printer-uri-supported" attribute. This attribute identifies the Client Authentication mechanism  
3851 associated with each URI listed in the "printer-uri-supported" attribute. The Printer object uses the  
3852 specified mechanism to identify the authenticated user (see section 8.3). The "i th" value in "uri-  
3853 authentication-supported" corresponds to the "i th" value in "printer-uri-supported" and it describes the  
3854 authentication mechanisms used by the Printer when accessed via that URI. See [IPP-PRO] for more  
3855 details on Client Authentication.

3856 The following standard keyword values are defined:

3857 'none': There is no authentication mechanism associated with the URI. The Printer object assumes  
3858 that the authenticated user is "anonymous".  
3859 'requesting-user-name': When a client performs an operation whose target is the associated URI, the  
3860 Printer object assumes that the authenticated user is specified by the "requesting-user-name"  
3861 Operation attribute (see section 8.3). If the "requesting-user-name" attribute is absent in a  
3862 request, the Printer object assumes that the authenticated user is "anonymous".  
3863 'basic': When a client performs an operation whose target is the associated URI, the Printer object  
3864 challenges the client with HTTP basic authentication. The Printer object assumes that the  
3865 authenticated user is the name received via the basic authentication mechanism.  
3866 'digest': When a client performs an operation whose target is the associated URI, the Printer object  
3867 challenges the client with HTTP digest authentication. The Printer object assumes that the  
3868 authenticated user is the name received via the digest authentication mechanism.  
3869 'certificate': When a client performs an operation whose target is the associated URI, the Printer  
3870 object expects the client to provide a certificate. The Printer object assumes that the authenticated  
3871 user is the textual name contained within the certificate.

3872 4.4.3 uri-security-supported (1setOf type2 keyword)

3873 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values)  
3874 as the "printer-uri-supported" attribute. This attribute identifies the security mechanisms used for each  
3875 URI listed in the "printer-uri-supported" attribute. The "i th" value in "uri-security-supported"  
3876 corresponds to the "i th" value in "printer-uri-supported" and it describes the security mechanisms used  
3877 for accessing the Printer object via that URI. See [IPP-PRO] for more details on security mechanisms.

3878 The following standard **keyword** values are defined:

3879 'none': There are no secure communication channel protocols in use for the given URI.  
3880 'ssl3': SSL3 [SSL] is the secure communications channel protocol in use for the given URI.  
3881 **'tls': TLS [RFC2246] is the secure communications channel protocol in use for the given URI.**

3883 This attribute is orthogonal to the specification of a Client Authentication mechanism. Specifically,  
3884 'none' does not exclude Client Authentication. See section 4.4.2. **Issue 21**

3885 Consider the following example. For a single Printer object, an administrator configures the "printer-uri-  
3886 supported", "uri-authentication-supported" and "uri-security-supported" attributes as follows:

3887 "printer-uri-supported": ~~httpxxx://acme.com/open-use-printer~~, ~~httpxxx://acme.com/restricted-use-~~  
3888 ~~printer~~, ~~httpxxx://acme.com/private-printer~~  
3889 "uri-authentication-supported": 'none', 'digest', 'basic'  
3890 "uri-security-supported": 'none', 'none', 'ssl3' tls  
3891

3892 Note: 'xxx' is not a valid scheme. See the IPP/1.1 "Transport and Encoding" specification [IPP-PRO]  
3893 for the actual URI schemes to be used in object target attributes.

3894 In this case, one Printer object has three URIs.

- 3895 - For the first URI, ~~httpxxx://acme.com/open-use-printer~~, the value 'none' in "uri-security-  
3896 supported" indicates that there is no secure channel protocol configured to run under HTTP. ~~The~~  
3897 ~~name implies that there is no Basic or Digest authentication being used, but it is up to the client~~  
3898 ~~to determine that while using HTTP value of 'none' in "uri-authentication-supported" indicates~~  
3899 ~~that all users are 'anonymous'. There will be no challenge and the Printer will ignore underneath~~  
3900 ~~the IPP application protocol.~~ "requesting-user-name".  
3901 - For the second URI, ~~httpxxx://acme.com/restricted-use-printer~~, the value 'none' in "uri-security-  
3902 supported" indicates that there is no secure channel protocol configured to run under HTTP. ~~In~~  
3903 ~~this case, although the name does imply that there is some sort of Basic or Digest authentication~~  
3904 ~~being used within HTTP, it is up to the~~ The value of 'digest' in "uri-authentication-supported"  
3905 indicates that the Printer will issue a challenge and that the Printer will use the name client to  
3906 determine that while using HTTP and by processing any '401 Unauthorized' HTTP error  
3907 messages supplied by the digest mechanism to determine the authenticated user (see section 8.3).  
3908 - For the third URI, ~~httpxxx://acme.com/private-printer~~, the value 'ssl3' ~~the value 'tls'~~ in "uri-  
3909 security-supported" indicates that SSL3 TLS is being used to secure the channel. The client  
3910 SHOULD be prepared to use SSL3 TLS framing to negotiate an acceptable ciphersuite to use  
3911 while communicating with the Printer object. In this case, the name implies the use of a secure  
3912 communications channel, but the fact is made explicit by the presence of the ~~'ssl3' 'tls'~~ value in  
3913 "uri-security-supported". The client does not need to resort to understanding which security it  
3914 must use by following naming conventions or by parsing the URI to determine which security  
3915 mechanisms are ~~implied.~~  
3916 implied. The value of 'basic' in "uri-authentication-supported" indicates that the Printer will issue a  
3917 challenge and that the Printer will use the name supplied by the digest mechanism to determine  
3918 the authenticated user (see section 8.3) . Because this challenge occurs in a tls session, the  
3919 channel is secure.  
3920

3921 It is expected that many IPP Printer objects will be configured to support only one channel (either  
3922 configured to use ~~SSL3 access or not~~, ~~and will therefore only ever~~ TLS access or not) and only one  
3923 authentication mechanism. Such Printer objects only have one URI listed in the "printer-uri-supported"  
3924 attribute. No matter the configuration of the Printer object (whether it has only one URI or more than  
3925 one URI), a client MUST supply only one URI in the target "printer-uri" operation attribute.

3926 4.4.4 printer-name (name(127))

3927 This REQUIRED Printer attribute contains the name of the Printer object. It is a name that is more end-  
3928 user friendly than a URI. An administrator determines a printer's name and sets this attribute to that  
3929 name. This name may be the last part of the printer's URI or it may be unrelated. In non-US-English  
3930 locales, a name may contain characters that are not allowed in a URI.

3931 4.4.5 printer-location (text(127))

3932 This Printer attribute identifies the location of the device. This could include things like: "in Room  
3933 123A, second floor of building XYZ".

3934 4.4.6 printer-info (text(127))

3935 This Printer attribute identifies the descriptive information about this Printer object. This could include  
3936 things like: "This printer can be used for printing color transparencies for HR presentations", or "Out of  
3937 courtesy for others, please print only small (1-5 page) jobs at this printer", or even "This printer is going  
3938 away on July 1, 1997, please find a new printer".

3939 4.4.7 printer-more-info (uri)

3940 This Printer attribute contains a URI used to obtain more information about this specific Printer object.  
3941 For example, this could be an HTTP type URI referencing an HTML page accessible to a Web Browser.  
3942 The information obtained from this URI is intended for end user consumption. Features outside the  
3943 scope of IPP can be accessed from this URI. The information is intended to be specific to this printer  
3944 instance and site specific services (e.g. job pricing, services offered, end user assistance). The device  
3945 manufacturer may initially populate this attribute.

3946 4.4.8 printer-driver-installer (uri)

3947 This Printer attribute contains a URI to use to locate the driver installer for this Printer object. This  
3948 attribute is intended for consumption by automata. The mechanics of print driver installation is outside  
3949 the scope of ~~IPP~~this IPP/1.1 document. The device manufacturer may initially populate this attribute.

3950 4.4.9 printer-make-and-model (text(127))

3951 This Printer attribute identifies the make and model of the device. The device manufacturer may  
3952 initially populate this attribute.

3953 4.4.10 printer-more-info-manufacturer (uri)

3954 This Printer attribute contains a URI used to obtain more information about this type of device. The  
3955 information obtained from this URI is intended for end user consumption. Features outside the scope of  
3956 IPP can be accessed from this URI (e.g., latest firmware, upgrades, print drivers, optional features  
3957 available, details on color support). The information is intended to be germane to this printer without

3958 regard to site specific modifications or services. The device manufacturer may initially populate this  
3959 attribute.

3960 4.4.11 printer-state (type1 enum)

3961 This REQUIRED Printer attribute identifies the current state of the device. The "printer-state reasons"  
3962 attribute augments the "printer-state" attribute to give more detailed information about the Printer in the  
3963 given printer state.

3964 A Printer object need only update this attribute before responding to an operation which requests the  
3965 attribute; the Printer object NEED NOT update this attribute continually, since asynchronous event  
3966 notification is not part of ~~IPP/1.0~~. IPP/1.1. A Printer NEED NOT implement all values if they are not  
3967 applicable to a given implementation.

3968 The following standard enum values are defined:

3969 Value Symbolic Name and Description

3970  
3971 '3' 'idle': If a Printer receives a job (whose required resources are ready) while in this state,  
3972 such a job MUST transit into the 'processing' state immediately. If the "printer-  
3973 state-reasons" attribute contains any reasons, they MUST be reasons that would  
3974 not prevent a job from transiting into the 'processing' state immediately, e.g.,  
3975 'toner-low'.

Note: If a Printer can interpret one or more jobs while marking a job, then it is idle  
if it is available to interpret jobs even while marking a job. Issue 31

If a Printer controls more than one output device, the above definition implies that  
a Printer is 'idle' if at least one output device is idle, i.e., the IPP Printer is  
available to immediately start processing a job if a client submitted it.

3984 '4' 'processing': If a Printer receives a job (whose required resources are ready) while in this  
3985 state, such a job MUST transit into the 'pending' state immediately. Such a job  
3986 MUST transit into the 'processing' state only after jobs ahead of it complete. If the  
3987 "printer-state-reasons" attribute contains any reasons, they MUST be reasons that  
3988 do not prevent the current job from printing, e.g. 'toner-low'.

Note: If a Printer can interpret one or more jobs while marking a job and receives a  
job (whose required resources are ready) while in this state, such a received job  
MAY transit into the 'processing' state along with the job that is being marked, if  
any. Issue 31

If a Printer controls more than one output device, the above definition implies that  
a Printer is 'processing' if at least one output device is processing, and none is idle.

3997

3998 '5' 'stopped': If a Printer receives a job (whose required resources are ready) while in this  
3999 state, such a job MUST transit into the 'pending' state immediately. Such a job  
4000 MUST transit into the 'processing' state only after some human fixes the problem  
4001 that stopped the printer and after jobs ahead of it complete processing. ~~If~~  
4002 ~~supported, the~~ **Issue 30** The "printer-state-reasons" attribute MUST contain at least  
4003 one reason, e.g. 'media-jam', which prevents it from either processing the current  
4004 job or transitioning a 'pending' job to the 'processing' state.

If a Printer can interpret one or more jobs while marking a job and receives a job  
(whose required resources are ready) while in this state, such a submitted job  
MAY transit into the 'processing' state in order to be interpreted even while the  
Printer is in the 'stopped' state. However, before such a job can be completed, a  
human needs to fix the problem. **Issue 31**

~~Note: if~~ **Note:** If a Printer controls more than one output device, the above definition  
implies that a Printer is 'stopped' only if all output devices are stopped.

~~Also,~~ **Note:** it is tempting to define 'stopped' as when a sufficient number of output  
devices are stopped and leave it to an implementation to define the sufficient  
number. But such a rule complicates the definition of 'stopped' and 'processing'.  
For example, with this alternate definition of 'stopped', a job can move from  
'pending' to 'processing' without human intervention, even though the Printer is  
stopped.

#### 4022 4.4.12 printer-state-reasons (1setOf type2 keyword)

4023 This **REQUIRED** Printer attribute supplies additional detail about the device's state. **Issue 30**

4024 Each keyword value MAY have a suffix to indicate its level of severity. The three levels are: report  
4025 (least severe), warning, and error (most severe).

- 4026 - '-report': This suffix indicates that the reason is a "report". An implementation may choose to omit  
4027 some or all reports. Some reports specify finer granularity about the printer state; others serve as  
4028 a precursor to a warning. A report MUST contain nothing that could affect the printed output.
- 4029 - '-warning': This suffix indicates that the reason is a "warning". An implementation may choose to  
4030 omit some or all warnings. Warnings serve as a precursor to an error. A warning MUST contain  
4031 nothing that prevents a job from completing, though in some cases the output may be of lower  
4032 quality.
- 4033 - '-error': This suffix indicates that the reason is an "error". An implementation MUST include all  
4034 errors. If this attribute contains one or more errors, printer MUST be in the stopped state.

4036 If the implementation does not add any one of the three suffixes, all parties MUST assume that the  
4037 reason is an "error".

4038 If a Printer object controls more than one output device, each value of this attribute MAY apply to one or  
4039 more of the output devices. An error on one output device that does not stop the Printer object as a  
4040 whole MAY appear as a warning in the Printer's "printer-state-reasons" attribute. If the "printer-state"  
4041 for such a Printer has a value of 'stopped', then there MUST be an error reason among the values in the  
4042 "printer-state-reasons" attribute.

4043 The following standard keyword values are defined:

4044 'other': The device has detected an error other than one listed in this document.

4045 'none': There are not reasons. This state reason is semantically equivalent to "printer-state-reasons"  
4046 without any value and MUST be used, since the 1setOf attribute syntax requires at least one  
4047 value.

4048 'media-needed': A tray has run out of media.

4049 'media-jam': The device has a media jam.

4050 'moving-to-paused': Someone has paused the Printer object using the Pause-Printer operation (see  
4051 section 3.2.7) or other means, but the device(s) are taking an appreciable time to stop. Later,  
4052 when all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces  
4053 the 'moving-to-paused' value in the "printer-state-reasons" attribute.

4054 'paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7)  
4055 or other means and the Printer object's "printer-state" is 'stopped'. In this state, a Printer MUST  
4056 NOT produce printed output, but it MUST perform other operations requested by a client. If a  
4057 Printer had been printing a job when the Printer was paused, the Printer MUST resume printing  
4058 that job when the Printer is no longer paused and leave no evidence in the printed output of such  
4059 a pause.

4060 'shutdown': Someone has removed a Printer object from service, and the device may be powered  
4061 down or physically removed. In this state, a Printer object MUST NOT produce printed output,  
4062 and unless the Printer object is realized by a print server that is still active, the Printer object  
4063 MUST perform no other operations requested by a client, including returning this value. If a  
4064 Printer object had been printing a job when it was shutdown, the Printer NEED NOT resume  
4065 printing that job when the Printer is no longer shutdown. If the Printer resumes printing such a  
4066 job, it may leave evidence in the printed output of such a shutdown, e.g. the part printed before  
4067 the shutdown may be printed a second time after the shutdown.

4068 'connecting-to-device': The Printer object has scheduled a job on the output device and is in the  
4069 process of connecting to a shared network output device (and might not be able to actually start  
4070 printing the job for an arbitrarily long time depending on the usage of the output device by other  
4071 servers on the network).

4072 'timed-out': The server was able to connect to the output device (or is always connected), but was  
4073 unable to get a response from the output device.

4074 'stopping': The Printer object is in the process of stopping the device and will be stopped in a while.  
4075 When the device is stopped, the Printer object will change the Printer object's state to 'stopped'.  
4076 The 'stopping-warning' reason is never an error, even for a Printer with a single output device.  
4077 When an output-device ceases accepting jobs, the Printer will have this reason while the output  
4078 device completes printing.

4079 'stopped-partly': When a Printer object controls more than one output device, this reason indicates  
4080 that one or more output devices are stopped. If the reason is a report, fewer than half of the

4081 output devices are stopped. If the reason is a warning, fewer than all of the output devices are  
4082 stopped.  
4083 'toner-low': The device is low on toner.  
4084 ~~'marker-supply-low':~~ 'toner-empty': The device is ~~low on marker supply (ink, paint, etc.)~~ out of toner.  
4085 'spool-area-full': The limit of persistent storage allocated for spooling has been reached.  
4086 'cover-open': One or more covers on the device are open.  
4087 'interlock-open': One or more interlock devices on the printer are unlocked.  
4088 'door-open': One or more doors on the device are open.  
4089 'input-tray-missing': One or more input trays are not in the device.  
4090 'media-low': At least one input tray is low on media.  
4091 'media-empty': At least one input tray is empty.  
4092 'output-tray-missing': One or more output trays are not in the device  
4093 'output-area-almost-full': One or more output area is almost full (e.g. tray, stacker, collator).  
4094 'output-area-full': One or more output area is full. (e.g. tray, stacker, collator)  
4095 'marker-supply-low': The device is low on at least one marker supply. (e.g. toner, ink, ribbon)  
4096 'marker-supply-empty': The device is out of at least one marker supply. (e.g. toner, ink, ribbon)  
4097 'marker-waste-almost-full': The device marker supply waste receptacle is almost full.  
4098 'marker-waste-full': The device marker supply waste receptacle is full.  
4099 'fuser-over-temp': The fuser temperature is above normal.  
4100 'fuser-under-temp': The fuser temperature is below normal.  
4101 'opc-near-eol': The optical photo conductor is near end of life.  
4102 'opc-life-over': The optical photo conductor is no longer functioning.  
4103 'developer-low': The device is low on developer.  
4104 'developer-empty': The device is out of developer.  
4105 'interpreter-resource-unavailable': An interpreter resource is unavailable (i.e. font, form)  
4106

#### 4107 4.4.13 printer-state-message (text(MAX))

4108 This Printer attribute specifies the additional information about the printer state and printer state reasons  
4109 in human readable text. If the Printer object supports this attribute, the Printer object MUST be able to  
4110 generate this message in any of the natural languages identified by the Printer's "generated-natural-  
4111 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in  
4112 Section 3.1.4.1).

#### 4113 4.4.14 ipp-versions-supported (1setOf type2 keyword) Issue 36

4114 This REQUIRED attribute identifies the IPP protocol versions that this Printer supports, including minor  
4115 versions, i.e., the values of the "version-number" parameter that it will accept in requests and return in  
4116 responses. If an IPP Printer receives a request with the "version-number" parameter set to a (two-octet  
4117 binary) value that does not correspond to one of the values of this (US-ASCII) keyword, it MUST reject  
4118 the request and return the 'server-error-version-not-supported' status code. See Section 3.1.8.

4119 The following standard keyword values are defined:

4120 '1.0': Version 1.0 as specified in RFC 2566 [RFC2566] and RFC 2565 [RFC2565] including any  
4121 extensions registered according to Section 1.1 and any extension defined in this version or any

4122 future version of this document following the rules when the "version-number" parameter is '1.0',  
4123 if any. For an example of such a '1.0' rule, see section 4.3.12.  
4124 '1.1': Version 1.1 as specified in this document and [IPP-PRO] including any extensions registered  
4125 according to Section 1.1 or defined in any future version of this document following the rules  
4126 when the "version-number" parameter is '1.1', if any.

4127 4.4.15 operations-supported (1setOf type2 enum)

4128 This REQUIRED Printer attribute specifies the set of supported operations for this Printer object and  
4129 contained Job objects.

4130 All Note: This attribute is encoded as any other enum attribute syntax according to [IPP-PRO] as 32-bits.  
4131 However, all 32-bit enum values for this attribute MUST NOT exceed 0x00008FFF, since these same  
4132 values are also passed in two octets in the "operation-id" parameter (see section 3.1.1) in each Protocol  
4133 request with the two high order octets omitted in order to indicate the operation being performed [IPP-  
4134 PRO].

4135 The following standard enum and "operation-id" (see section 3.1.2) values are defined:

4136	Value	Operation Name
4137	-----	-----
4138		
4139	0x0000	reserved, not used
4140	0x0001	reserved, not used
4141	0x0002	Print-Job
4142	0x0003	Print-URI
4143	0x0004	Validate-Job
4144	0x0005	Create-Job
4145	0x0006	Send-Document
4146	0x0007	Send-URI
4147	0x0008	Cancel-Job
4148	0x0009	Get-Job-Attributes
4149	0x000A	Get-Jobs
4150	0x000B	Get-Printer-Attributes
4151	<u>0x000C</u>	<u>Hold-Job</u>
4152	<u>0x000D</u>	<u>Release-Job</u>
4153	<u>0x000E</u>	<u>Restart-Job</u>
4154	<u>0x000F</u>	<u>reserved for a future operation</u>
4155	<u>0x0010</u>	<u>Pause-Printer</u>
4156	<u>0x0011</u>	<u>Resume-Printer</u>
4157	<u>0x0012</u>	<u>Purge-Jobs</u>
4158	<u>0x000C-0x3FFF</u> <u>0x00013-0x3FFF</u>	reserved for future operations
4159	0x4000-0x8FFF	reserved for private extensions
4160		

4161 ~~This~~ The reserved block for private extensions allows for ~~ertain~~ vendors to implement private extensions  
4162 that are guaranteed to not conflict with future registered extensions. However, there is no guarantee that  
4163 two or more private extensions will not conflict.

#### 4164 4.4.16 multiple-document-jobs-supported (boolean) **Issue 34**

4165 This Printer attribute indicates whether or not the Printer supports more than one document per job, i.e.,  
4166 more than one Send-Document or Send-Data operation with document data. If the Printer supports the  
4167 Create-Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

#### 4168 4.4.17 charset-configured (charset)

4169 This REQUIRED Printer attribute identifies the charset that the Printer object has been configured to  
4170 represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or  
4171 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-  
4172 make-and-model" (text). Therefore, the value of the Printer object's "charset-configured" attribute  
4173 MUST also be among the values of the Printer object's "charset-supported" attribute.

#### 4174 4.4.18 charset-supported (1setOf charset)

4175 This REQUIRED Printer attribute identifies the set of charsets that the Printer and contained Job objects  
4176 support in attributes with attribute syntax 'text' and 'name'. At least the value 'utf-8' MUST be present,  
4177 since IPP objects MUST support the UTF-8 ~~[RFC2044]~~ [RFC2279] charset. If a Printer object supports  
4178 a charset, it means that for all attributes of syntax 'text' and 'name' the IPP object MUST (1) accept the  
4179 charset in requests and return the charset in responses as needed.

4180 If more charsets than UTF-8 are supported, the IPP object MUST perform charset conversion between  
4181 the charsets as described in Section 3.1.4.2.

#### 4182 4.4.19 natural-language-configured (naturalLanguage)

4183 This REQUIRED Printer attribute identifies the natural language that the Printer object has been  
4184 configured to represent 'text' and 'name' Printer attributes that are set by the operator, system  
4185 administrator, or manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info"  
4186 (text), and "printer-make-and-model" (text). When returning these Printer attributes, the Printer object  
4187 MAY return them in the configured natural language specified by this attribute, instead of the natural  
4188 language requested by the client in the "attributes-natural-language" operation attribute. See Section  
4189 3.1.4.1 for the specification of the OPTIONAL multiple natural language support. Therefore, the value  
4190 of the Printer object's "natural-language-configured" attribute MUST also be among the values of the  
4191 Printer object's "generated-natural-language-supported" attribute.

#### 4192 4.4.20 generated-natural-language-supported (1setOf naturalLanguage)

4193 This REQUIRED Printer attribute identifies the natural language(s) that the Printer object and contained  
4194 Job objects support in attributes with attribute syntax 'text' and 'name'. The natural language(s)

4195 supported depends on implementation and/or configuration. Unlike charsets, IPP objects MUST accept  
4196 requests with any natural language or any Natural Language Override whether the natural language is  
4197 supported or not.

4198 If a Printer object supports a natural language, it means that for any of the attributes for which the Printer  
4199 or Job object generates messages, i.e., for the "job-state-message" and "printer-state-message" attributes  
4200 and Operation Messages (see Section 3.1.5) in operation responses, the Printer and Job objects MUST be  
4201 able to generate messages in any of the Printer's supported natural languages. See section 3.1.4 for the  
4202 specification of 'text' and 'name' attributes in operation requests and responses.

4203 Note: A Printer object that supports multiple natural languages, often has separate catalogs of messages,  
4204 one for each natural language supported.

#### 4205 4.4.21 document-format-default (mimeMediaType)

4206 This REQUIRED Printer attribute identifies the document format that the Printer object has been  
4207 configured to assume if the client does not supply a "document-format" operation attribute in any of the  
4208 operation requests that supply document data. The standard values for this attribute are Internet Media  
4209 types (sometimes called MIME types). For further details see the description of the 'mimeMediaType'  
4210 attribute syntax in Section 4.1.9.

#### 4211 4.4.22 document-format-supported (1setOf mimeMediaType)

4212 This REQUIRED Printer attribute identifies the set of document formats that the Printer object and  
4213 contained Job objects can support. For further details see the description of the 'mimeMediaType'  
4214 attribute syntax in Section 4.1.9.

#### 4215 4.4.23 printer-is-accepting-jobs (boolean)

4216 This REQUIRED Printer attribute indicates whether the printer is currently able to accept jobs, i.e., is  
4217 accepting Print-Job, Print-URI, and Create-Job requests. If the value is 'true', the printer is accepting  
4218 jobs. If the value is 'false', the Printer object is currently rejecting any jobs submitted to it. In this case,  
4219 the Printer object returns the 'server-error-not-accepting-jobs' status code.

4220 Note: This value is independent of the "printer-state" and "printer-state-reasons" attributes because its  
4221 value does not affect the current job; rather it affects future jobs. This attribute may cause the Printer to  
4222 reject jobs when the "printer-state" is 'idle' or it may cause the Printer object to accept jobs when the  
4223 "printer-state" is 'stopped'.

#### 4224 4.4.24 queued-job-count (integer(0:MAX))

4225 This ~~RECOMMENDED~~REQUIRED Printer attribute contains a count of the number of jobs that are  
4226 either 'pending', 'processing', 'pending-held', or 'processing-stopped' and is set by the Printer object. **Issue**  
4227 **29**

4228 4.4.25 printer-message-from-operator (text(127))

4229 This Printer attribute provides a message from an operator, system administrator or "intelligent" process  
4230 to indicate to the end user information or status of the printer, such as why it is unavailable or when it is  
4231 expected to be available.

4232 4.4.26 color-supported (boolean)

4233 This Printer attribute identifies whether the device is capable of any type of color printing at all,  
4234 including highlight color. All document instructions having to do with color are embedded within the  
4235 document PDL (none are external IPP attributes in ~~IPP/1.0~~:IPP/1.1).

4236 Note: end-users are able to determine the nature and details of the color support by querying the  
4237 "printer-more-info-manufacturer" Printer attribute.

4238 4.4.27 reference-uri-schemes-supported (1setOf uriScheme)

4239 This Printer attribute specifies which URI schemes are supported for use in the "document-uri" operation  
4240 attribute of the Print-URI or Send-URI operation. If a Printer object supports these optional operations,  
4241 it MUST support the "reference-uri-schemes-supported" Printer attribute with at least the following  
4242 schemed URI value:

4243     'ftp': The Printer object will use an FTP 'get' operation as defined in RFC 2228 [RFC2228] using  
4244     FTP URLs as defined by [RFC2396] and [RFC2316].  
4245

4246 The Printer object MAY OPTIONALLY support other URI schemes (see section 4.1.6).

4247 4.4.28 pdl-override-supported (type2 keyword)

4248 This REQUIRED Printer attribute expresses the ability for a particular Printer implementation to either  
4249 attempt to override document data instructions with IPP attributes or not.

4250 This attribute takes on the following values:

- 4251 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values  
4252     take precedence over embedded instructions in the document data, however there is no guarantee.
- 4253 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP  
4254     attribute values take precedence over embedded instructions in the document data.  
4255

4256 Section 15 contains a full description of how this attribute interacts with and affects other IPP attributes,  
4257 especially the "ipp-attribute-fidelity" attribute.

4258 4.4.29 printer-up-time (integer(1:MAX))

4259 This REQUIRED Printer attribute indicates the amount of time (in seconds) that this Printer instance of  
4260 this Printer implementation has been up and running. This value is used to populate the Job attributes

4261 ~~"time-at-creation", "time-at-processing", and "time-at-completed". These time values are all measured in~~  
4262 ~~seconds and all have meaning only relative to this attribute, "printer-up-time".~~ The value is a  
4263 monotonically increasing value starting from 1 when the Printer object is started-up (initialized, booted,  
4264 etc.).

4265 This value or the value of "printer-current-time" is used to populate the Event Time Job Description  
4266 attributes "time-at-creation", "time-at-processing", and "time-at-completed", depending on  
4267 implementation (see Section 4.3.12).

4268 ~~If the Printer object goes down at some value 'n', and comes back up, the implementation MAY:~~

- 4269 ~~1. Know how long it has been down, and resume at some value greater than 'n', or~~  
4270 ~~2. Restart from 1.~~

4271

4272 ~~In the first case, the Printer SHOULD not tweak any existing related Job attributes ("time-at-creation",~~  
4273 ~~"time-at-processing", and "time-at-completed"). In the second case, the Printer object SHOULD reset~~  
4274 ~~those attributes to 0. If a client queries a time-related Job attribute and finds the value to be 0, the client~~  
4275 ~~MUST assume that the Job was submitted in some life other than the Printer's current life.~~

4276 If the Printer object software ceases running, and restarts without knowing the last value for "printer-up-  
4277 time", the implementation MUST reset this value to 1. However, if the device or devices that the Printer  
4278 object is representing are restarted or power cycled, the Printer object MAY continue counting this value  
4279 or MAY reset this value to 1 depending on implementation. If this value is reset and the implementation  
4280 has persistent jobs and the Event Time Job Description Attributes are represented using the 'integer' form  
4281 (instead of the 'dateTime' form), they MUST be reset according to Section 4.3.12. Issue 17

#### 4282 4.4.30 printer-current-time (dateTime)

4283 This Printer attribute indicates the current ~~absolute~~ wall-clock time. ~~If an implementation supports~~  
4284 ~~this attribute, then a client could calculate the absolute wall-clock time each Job's~~ This value or the value  
4285 of "printer-uptime-time" is used to populate the Job attributes "time-at-creation", "time-at-processing",  
4286 and "time-at-completed" attributes by using both "printer-up-time" and this attribute, "printer-current-  
4287 time". "time-at-completed", depending on implementation (see Section 4.3.12).

4288 ~~If an implementation does not support this attribute, a client can only calculate the relative time of~~  
4289 ~~certain events based on the REQUIRED "printer-up-time" attribute.~~

4290 The date and time is obtained on a "best efforts basis" and does not have to be that precise in order to  
4291 work in practice. A Printer implementation sets the value of this attribute by obtaining the date and time  
4292 via some implementation-dependent means, such as getting the value from a network time server,  
4293 initialization at time of manufacture, or setting by an administrator. See [IPP-IIG] for examples. If an  
4294 implementation supports this attribute and the implementation knows that it has not yet been set to a  
4295 correct value, then the implementation MUST return the value of this attribute using the out-of-band 'no-  
4296 value' meaning not configured. See the beginning of section 4.1. Issue 17

4297 The time zone of this attribute NEED NOT be the time zone used by people located near the Printer  
4298 object or device. The client MUST NOT expect that the time zone of any received 'dateTime' value to  
4299 be in the time zone of the client or in the time zone of the people located near the printer. Issue 17

4300 The client SHOULD display any dateTime attributes to the user in client local time by converting the  
4301 'dateTime' value returned by the server to the time zone of the client, rather than using the time zone  
4302 returned by the Printer in attributes that use the 'dateTime' attribute syntax. Issue 17

#### 4303 4.4.31 multiple-operation-time-out (integer(1:MAX))

4304 This Printer attribute identifies the minimum time (in seconds) that the Printer object waits for  
4305 additional Send-Document or Send-URI operations to follow a still-open multi-document Job object  
4306 before taking any recovery actions, such as the ones indicated in section 3.3.1:

4307 . If the Printer object supports the Create-Job and Send-Document operations (see section 3.2.4 and  
4308 3.3.1), it MUST support this attribute.

4309 It is RECOMMENDED that vendors supply a value for this attribute that is between 60 and 240  
4310 seconds. An implementation MAY allow a system administrator to set this attribute (by means outside  
4311 this IPP/1.1 document). If so, the system administrator MAY be able to set values outside this range.

#### 4312 4.4.32 compression-supported (1setOf type3 keyword)

4313 This **REQUIRED** Printer attribute identifies the set of supported compression algorithms for document  
4314 data. Compression only applies to the document data; compression does not apply to the encoding of the  
4315 IPP operation itself. The supported values are used to validate the client supplied "compression"  
4316 operation attributes in Print-Job, Send-Document, and Send-URI requests. **Issue 28**

4317 Standard values are :

- 4318 'none': no compression is used.
- 4319 'deflate': ZIP public domain inflate/deflate) compression technology
- 4320 'gzip' GNU zip compression technology described in RFC 1952 [RFC1952].
- 4321 'compress': UNIX compression technology

#### 4323 4.4.33 job-k-octets-supported (rangeOfInteger(0:MAX))

4324 This Printer attribute specifies the upper and lower bounds of total sizes of jobs in K octets, i.e., in units  
4325 of 1024 octets. The supported values are used to validate the client supplied "job-k-octets" operation  
4326 attributes in create requests. The corresponding job description attribute "job-k-octets" is defined in  
4327 section 4.3.15.1.

4328 4.4.34 job-impressions-supported (rangeOfInteger(0:MAX))

4329 This Printer attribute specifies the upper and lower bounds for the number of impressions per job. The  
4330 supported values are used to validate the client supplied "job-impressions" operation attributes in create  
4331 requests. The corresponding job description attribute "job-impressions" is defined in section 4.3.15.2.

4332 4.4.35 job-media-sheets-supported (rangeOfInteger(0:MAX))

4333 This Printer attribute specifies the upper and lower bounds for the number of media sheets per job. The  
4334 supported values are used to validate the client supplied "job-media-sheets" operation attributes in create  
4335 requests. The corresponding Job attribute "job-media-sheets" is defined in section 4.3.15.3.

4336 4.4.36 pages-per-minute (integer(0:MAX))

4337 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number  
4338 which may be generated by this printer (e.g., simplex, black-and-white). This attribute is informative,  
4339 not a service guarantee. Generally, it is the value used in the marketing literature to describe the device.

4340 A value of 0 indicates a device that takes more than two minutes to process a page.

4341 4.4.37 pages-per-minute-color (integer(0:MAX))

4342 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number  
4343 which may be generated by this printer when printing color (e.g., simplex, color). For purposes of this  
4344 attribute, "color" means the same as for the "color-supported" attribute, namely, the device is capable of  
4345 any type of color printing at all, including highlight color. This attribute is informative, not a service  
4346 guarantee. Generally, it is the value used in the marketing literature to describe the color capabilities of  
4347 this device.

4348 A value of 0 indicates a device that takes more than two minutes to process a page.

4349 Note: If a color device has several color modes, it MAY use the pages-per-minute value for this  
4350 attribute that corresponds to the mode that produces the highest number.

4351 Black and white only printers MUST NOT support this attribute. If this attribute is present, then the  
4352 "color-supported" Printer description attribute MUST be present and have a 'true' value.

4353 Note: The values of these two attributes returned by the Get-Printer-Attributes operation MAY be  
4354 affected by the "document-format" attribute supplied by the client in the Get-Printer-Attributes request.  
4355 In other words, the implementation MAY have different speeds depending on the document format  
4356 being processed. See section 3.2.5.1 Get-Printer-Attributes.

4357 5. Conformance

4358 This section describes conformance issues and requirements. This document introduces model entities  
4359 such as objects, operations, attributes, attribute syntaxes, and attribute values. These conformance  
4360 sections describe the conformance requirements which apply to these model entities.

4361 5.1 Client Conformance Requirements

4362 This section describes the conformance requirements for a client (see section 2.1), whether it be:

- 4363 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
4364 application or
- 4365 2. a component of a print server that communicates (using IPP operations) with either an output  
4366 device or another "downstream" print server. Issue 4 and Issue 5

4367 A conforming client MUST support all REQUIRED operations as defined in this document. For each  
4368 attribute included in an operation request, a conforming client MUST supply a value whose type and  
4369 value syntax conforms to the requirements of the Model document as specified in Sections 3 and 4. A  
4370 conforming client MAY supply any registered extensions and/or private extensions in an operation  
4371 request, as long as they meet the requirements in Section 1.1.

4372 Otherwise, there are no conformance requirements placed on the user interfaces provided by IPP clients  
4373 or their applications. For example, one application might not allow an end user to submit multiple  
4374 documents per job, while another does. One application might first query a Printer object in order to  
4375 supply a graphical user interface (GUI) dialogue box with supported and default values whereas a  
4376 different implementation might not.

4377 When sending a request, an IPP client NEED NOT supply any attributes that are indicated as  
4378 OPTIONALLY supplied by the client.

4379 A client MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their full  
4380 range, that may be returned to it in a response from a Printer object. In particular for each attribute that  
4381 the client supports whose attribute syntax is 'text', the client MUST accept and process both the  
4382 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the client  
4383 supports whose attribute syntax is 'name', the client MUST accept and process both the  
4384 'nameWithoutLanguage' and 'nameWithLanguage' forms. For presentation purposes, truncation of long  
4385 attribute values is not recommended. A recommended approach would be for the client implementation  
4386 to allow the user to scroll through long attribute values.

4387 A ~~query~~ response ~~may~~ **MAY** contain attribute groups, attributes, and values that the client does not  
4388 expect. Therefore, a client implementation MUST gracefully handle such responses and not refuse to  
4389 inter-operate with a conforming Printer that is returning ~~extended~~ registered or private ~~attributes~~  
4390 ~~and/or extensions, including attribute groups, attributes, and~~ attribute values that conform to Section 1.1.  
4391 Clients may choose to ignore any parameters, attributes, or values that they do not understand. **Issue 25**  
4392 **and Issue 26**

4393 While a client is sending data to a printer, it SHOULD do its best to prevent a channel from being closed  
4394 by a lower layer when the channel is blocked (i.e. flow-controlled off) for whatever reason, e.g. 'out of  
4395 paper' or 'job ahead hasn't freed up enough memory'. However, the layer that launched the print  
4396 submission (e.g. an end user) MAY close the channel in order to cancel the job. When a client closes a  
4397 channel, a Printer MAY print all or part of the received portion of the document. See the "Encoding and  
4398 Transport" document [IPP-PRO] for more details. Issue 4 and Issue 5

4399 A client MUST/SHOULD [which is to be determined in consultation with the Area Director] support  
4400 Client Authentication as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A client  
4401 SHOULD support Operation Privacy and Server Authentication as defined in the IPP/1.1 Encoding and  
4402 Transport document [IPP-PRO]. See also [IPP-MOD] section 8. Issue 32

4403 5.2 IPP Object Conformance Requirements

4404 This section specifies the conformance requirements for conforming implementations with respect to  
4405 objects, operations, and attributes whether they be (1) IPP objects that accept IPP requests and control  
4406 one or more devices or are embedded in a single device or (2) servers that accept IPP requests and  
4407 forward them to networked attributes.devices (using IPP or other protocol).

4408 5.2.1 Objects

4409 Conforming implementations MUST implement all of the model objects as defined in this specification  
4410 in the indicated sections:

- 4411 Section 2.1 - Printer Object
- 4412 Section 2.2 - Job Object

4413 whether they are (embedded) software that controls a device or are part of a print server that accepts IPP  
4414 operation requests and, in turn, sends operation requests using (the IPP or other) protocol to one or more  
4415 networked device(s). See sections 2.1 and 2.2.

4416 5.2.2 Operations

4417 Conforming IPP object implementations MUST implement all of the REQUIRED model operations,  
4418 including REQUIRED responses, as defined in this specification in the indicated sections:

4419 For a Printer object:

4420	Print-Job (section 3.2.1)	REQUIRED
4421	Print-URI (section 3.2.2)	OPTIONAL
4422	Validate-Job (section 3.2.3)	REQUIRED
4423	Create-Job (section 3.2.4)	OPTIONAL
4424	Get-Printer-Attributes (section 3.2.5)	REQUIRED
4425	Get-Jobs (section 3.2.6)	REQUIRED
4426	<u>Pause-Printer (section 3.2.7)</u>	<u>OPTIONAL</u>
4427	<u>Resume-Printer (section 3.2.8)</u>	<u>OPTIONAL</u>
4428	<u>Purge-Jobs (section 3.2.9)</u>	<u>OPTIONAL</u>

4429

4430 For a Job object:

4431	Send-Document (section 3.3.1)	OPTIONAL
4432	Send-URI (section 3.3.2)	OPTIONAL
4433	Cancel-Job (section 3.3.3)	REQUIRED
4434	Get-Job-Attributes (section 3.3.4)	REQUIRED
4435	<u>Hold-Job (section 3.3.5)</u>	<u>OPTIONAL</u>
4436	<u>Release-Job (section 3.3.6)</u>	<u>OPTIONAL</u>
4437	<u>Restart-Job (section 3.3.7)</u>	<u>OPTIONAL</u>

4438

4439 Conforming IPP objects MUST support all REQUIRED operation attributes and all values of such  
4440 attributes if so indicated in the description. Conforming IPP objects MUST ignore all unsupported or  
4441 unknown operation attributes or operation attribute groups received in a request, but MUST reject a  
4442 request that contains a supported operation attribute that contains an unsupported value.

4443 Conforming IPP objects MAY return operation responses that contain attributes groups, attributes name  
4444 and attribute values that are extensions to this standard. The additional attribute groups MAY occur in  
4445 any order. Issue 26

4446 The following section on object attributes specifies the support required for object attributes.

### 4447 5.2.3 IPP Object Attributes

4448 Conforming IPP objects MUST support all of the REQUIRED object attributes, as defined in this  
4449 specification in the indicated sections.

4450 If an object supports an attribute, it MUST support only those values specified in this document or  
4451 through the extension mechanism described in section 5.2.4. It MAY support any non-empty subset of  
4452 these values. That is, it MUST support at least one of the specified values and at most all of them.

### 4453 5.2.4 Versions

4454 Clients MUST support version 1.1 and SHOULD also support version 1.0. IPP objects MUST support  
4455 version 1.1 and SHOULD also support version 1.0. See section 3.1.8. ISSUE 36

### 4456 5.2.5 Extensions

4457 A conforming IPP object MAY support registered extensions and private extensions, as long as they  
4458 meet the requirements specified in Section 1.1.

4459 For each attribute included in an operation response, a conforming IPP object MUST return a value  
4460 whose type and value syntax conforms to the requirement of the Model document as specified in  
4461 Sections 3 and 4.

4462 5.2.6 Attribute Syntaxes

4463 An IPP object MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including  
4464 their full range, in any operation in which a client may supply attributes or the system administrator may  
4465 configure attributes (by means outside the scope of ~~IPP/1.0~~this IPP/1.1 document). In particular for  
4466 each attribute that the IPP object supports whose attribute syntax is 'text', the IPP object MUST accept  
4467 and process both the 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute  
4468 that the IPP object supports whose attribute syntax is 'name', the IPP object MUST accept and process  
4469 both the 'nameWithoutLanguage' and 'nameWithLanguage' forms. Furthermore, an IPP object MUST  
4470 return attributes to the client in operation responses that conform to the syntax specified in Section 4.1,  
4471 including their full range if supplied previously by a client.

4472 5.2.7 Security Issue 32

4473 An IPP Printer implementation MUST/SHOULD [which is to be determined in consultation with the  
4474 Area Director] contain support for Client Authentication as defined in the IPP/1.1 Encoding and  
4475 Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to configure  
4476 the Printer so that all, some, or none of the users are authenticated. See also [IPP-MOD] section 8.

4477 An IPP Printer implementation SHOULD contain support for Operation Privacy and Server  
4478 Authentication as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer  
4479 implementation MAY allow an administrator to configure the degree of support for Operation Privacy  
4480 and Server Authentication. See also [IPP-MOD] section 8.

4481 5.3 Charset and Natural Language Requirements

4482 All clients and IPP objects MUST support the 'utf-8' charset as defined in section 4.1.7.

4483 IPP objects MUST be able to accept any client request which correctly uses the "attributes-natural-  
4484 language" operation attribute or the Natural Language Override mechanism on any individual attribute  
4485 whether or not the natural language is supported by the IPP object. If an IPP object supports a natural  
4486 language, then it MUST be able to translate (perhaps by table lookup) all generated 'text' or 'name'  
4487 attribute values into one of the supported languages (see section 3.1.4). That is, the IPP object that  
4488 supports a natural language NEED NOT be a general purpose translator of any arbitrary 'text' or 'name'  
4489 value supplied by the client into that natural language. However, the object MUST be able to translate  
4490 (automatically generate) any of its own attribute values and messages into that natural language.

4491 ~~5.4 Security Conformance Requirements~~

4492 ~~Conforming IPP Printer objects MAY support Secure Socket Layer Version 3 (SSL3) [SSL] access,~~  
4493 ~~support access without SSL3 or support both means of access.~~

4494 ~~Conforming IPP clients SHOULD support SSL3 access and non-SSL3 access. Note: This client~~  
4495 ~~requirement to support both means that conforming IPP clients will be able to inter-operate with any IPP~~  
4496 ~~Printer object.~~

4497 ~~For a detailed discussion of security considerations and the IPP application security profile required for~~  
4498 ~~SSL3 support, see section 8.~~

4499 6. IANA Considerations (registered and private extensions)

4500 This section describes how IPP can be extended to allow the following registered and private extensions  
4501 to IPP:

- 4502 1. keyword attribute values
- 4503 2. enum attribute values
- 4504 3. attributes
- 4505 4. attribute syntaxes
- 4506 5. operations
- 4507 6. attribute groups
- 4508 7. status codes

4509

4510 Extensions registered for use with ~~IPP/1.0~~IPP/1.1 are OPTIONAL for client and IPP object conformance  
4511 to the ~~IPP/1.0~~IPP/1.1 Model specification.

4512 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON].  
4513 Section 11 describes how to propose new registrations for consideration. IANA will reject registration  
4514 proposals that leave out required information or do not follow the appropriate format described in  
4515 Section 11. IPP/1.1 may also be extended by an appropriate RFC that specifies any of the above  
4516 extensions.

4517 6.1 Typed 'keyword' and 'enum' Extensions

4518 IPP allows for 'keyword' and 'enum' extensions (see sections 4.1.2.3 and 4.1.4). This document uses  
4519 prefixes to the 'keyword' and 'enum' basic attribute syntax type in order to communicate extra  
4520 information to the reader through its name. This extra information is not represented in the protocol  
4521 because it is unimportant to a client or Printer object. The list below describes the prefixes and their  
4522 meaning.

4523 "type1": The IPP specification must be revised to add a new keyword or a new enum. No private  
4524 keywords or enums are allowed.

4525

4526 "type2": Implementers can, at any time, add new keyword or enum values by proposing the  
4527 complete specification to IANA:

4528

4529 iana@iana.org

4530

4531 IANA will forward the registration proposal to the IPP Designated Expert who will review the  
4532 proposal with a mailing list that the Designated Expert keeps for this purpose. Initially, that list  
4533 will be the mailing list used by the IPP WG:

4534

4535 ipp@pwg.org

4536

4537 even after the IPP WG is disbanded as permitted by [IANA-CON]. The IPP Designated Expert  
4538 is appointed by the IESG Area Director responsible for IPP, according to [IANA-CON].

4539

4540 When a type2 keyword or enum is approved, the IPP Designated Expert becomes the point of  
4541 contact for any future maintenance that might be required for that registration.

4542

4543 "type3": Implementers can, at any time, add new keyword and enum values by submitting the  
4544 complete specification to IANA as for type2 who will forward the proposal to the IPP Designated  
4545 Expert. While no additional technical review is required, the IPP Designated Expert may, at  
4546 his/her discretion, forward the proposal to the same mailing list as for type2 registrations for  
4547 advice and comment.

4548

4549 When a type3 keyword or enum is approved by the IPP Designated Expert, the original proposer  
4550 becomes the point of contact for any future maintenance that might be required for that  
4551 registration.

4552

4553 For type2 and type3 keywords, the proposer includes the name of the keyword in the registration  
4554 proposal and the name is part of the technical review.

4555 After type2 and type3 enums specifications are approved, the IPP Designated Expert in consultation with  
4556 IANA assigns the next available enum number for each enum value.

4557 IANA will publish approved type2 and type3 keyword and enum attributes value registration  
4558 specifications in:

4559 ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt

4560 where xxx is the attribute name that specifies the initial values and yyy.txt is a descriptive file name that  
4561 contains one or more enums or keywords approved at the same time. For example, if several additional  
4562 enums for stapling are approved for use with the "finishings" attribute (and "finishings-default" and  
4563 "finishings-supported" attributes), IANA will publish the additional values in the file:

4564 ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt

4565 Note: Some attributes are defined to be: 'type3 keywords' | 'name' which allows for attribute values to be  
4566 extended by a site administrator with administrator defined names. Such names are not registered with  
4567 IANA.

4568 By definition, each of the three types above assert some sort of registry or review process in order for  
4569 extensions to be considered valid. Each higher numbered level (1, 2, 3) tends to be decreasingly less  
4570 stringent than the previous level. Therefore, any typeN value MAY be registered using a process for  
4571 some typeM where M is less than N, however such registration is NOT REQUIRED. For example, a  
4572 type3 value MAY be registered in a type 1 manner (by being included in a future version of an IPP  
4573 specification), however, it is NOT REQUIRED.

4574 This specification defines keyword and enum values for all of the above types, including type3  
4575 keywords.

4576 For private (unregistered) keyword extensions, implementers SHOULD use keywords with a suitable  
4577 distinguishing prefix, such as "xxx-" where xxx is the (lowercase) fully qualified company name  
4578 registered with IANA for use in domain names [RFC1035]. For example, if the company XYZ Corp.  
4579 had obtained the domain name "XYZ.com", then a private keyword 'abc' would be: 'xyz.com-abc'.

4580 Note: RFC 1035 [RFC1035] indicates that while upper and lower case letters are allowed in domain  
4581 names, no significance is attached to the case. That is, two names with the same spelling but different  
4582 case are to be treated as if identical. Also, the labels in a domain name must follow the rules for  
4583 ARPANET host names: They must start with a letter, end with a letter or digit, and have as interior  
4584 characters only letters, digits, and hyphen. Labels must be 63 characters or less. Labels are separated by  
4585 the "." character.

4586 For private (unregistered) enum extension, implementers MUST use values in the reserved integer range  
4587 which is 2\*\*30 to 2\*\*31-1.

## 4588 6.2 Attribute Extensibility

4589 Attribute names are type2 keywords. Therefore, new attributes may be registered and have the same  
4590 status as attributes in this document by following the type2 extension rules. For private (unregistered)  
4591 attribute extensions, implementers SHOULD use keywords with a suitable distinguishing prefix as  
4592 described in Section 6.1.

4593 IANA will publish approved attribute registration specifications as separate files:

4594 ftp.isi.edu/iana/assignments/ipp/attributes/xxx-yyy.txt

4595 where "xxx-yyy" is the new attribute name.

4596 If a new Printer object attribute is defined and its values can be affected by a specific document format,  
4597 its specification needs to contain the following sentence:

4598 "The value of this attribute returned in a Get-Printer-Attributes response MAY depend on the  
4599 "document-format" attribute supplied (see Section 3.2.5.1)."

4600 If the specification does not, then its value in the Get-Printer-Attributes response MUST NOT depend on  
4601 the "document-format" supplied in the request. When a new Job Template attribute is registered, the

4602 value of the Printer attributes MAY vary with "document-format" supplied in the request without the  
4603 specification having to indicate so.

### 4604 6.3 Attribute Syntax Extensibility

4605 Attribute syntaxes are like type2 enums. Therefore, new attribute syntaxes may be registered and have  
4606 the same status as attribute syntaxes in this document by following the type2 extension rules described in  
4607 Section 6.1. The value codes that identify each of the attribute syntaxes are assigned in the ~~Encoding~~  
4608 ~~and Transport~~ "Encoding and Transport" specification [IPP-PRO], including a designated range for  
4609 private, experimental use.

4610 For attribute syntaxes, the IPP Designated Expert in consultation with IANA assigns the next attribute  
4611 syntax code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute  
4612 syntax registration specifications as separate files:

4613 ftp.isi.edu/iana/assignments/ipp/attribute-syntaxes/xxx-yyy.txt

4614 where 'xxx-yyy' is the new attribute syntax name.

### 4615 6.4 Operation Extensibility

4616 Operations may also be registered following the type2 procedures described in Section 6.1, though major  
4617 new operations will usually be done by a new standards track RFC that augments this document. For  
4618 private (unregistered) operation extensions, implementers MUST use the range for the "operation-id" in  
4619 requests specified in Section 4.4.15 "operations-supported" Printer attribute.

4620 For operations, the IPP Designated Expert in consultation with IANA assigns the next operation-id code  
4621 as specified in Section 4.4.15. IANA will publish approved operation registration specifications as  
4622 separate files:

4623 ftp.isi.edu/iana/assignments/ipp/operations/Xxx-Yyy.txt

4624 where "Xxx-Yyy" is the new operation name.

### 4625 6.5 Attribute Groups

4626 Attribute groups passed in requests and responses may be registered following the type2 procedures  
4627 described in Section 6.1. The tags that identify each of the attribute groups are assigned in [IPP-PRO].

4628 For attribute groups, the IPP Designated Expert in consultation with IANA assigns the next attribute  
4629 group tag code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved  
4630 attribute group registration specifications as separate files:

4631 ftp.isi.edu/iana/assignments/ipp/attribute-group-tags/xxx-yyy-tag.txt

4632 where 'xxx-yyy-tag' is the new attribute group tag name.

## 4633 6.6 Status Code Extensibility

4634 Operation status codes may also be registered following the type2 procedures described in Section 6.1.  
4635 The values for status codes are allocated in ranges as specified in Section 14 for each status code class:

- 4636 "informational" - Request received, continuing process
- 4637 "successful" - The action was successfully received, understood, and accepted
- 4638 "redirection" - Further action must be taken in order to complete the request
- 4639 "client-error" - The request contains bad syntax or cannot be fulfilled
- 4640 "server-error" - The IPP object failed to fulfill an apparently valid request

4641

4642 For private (unregistered) operation status code extensions, implementers MUST use the top of each  
4643 range as specified in Section 13.

4644 For operation status codes, the IPP Designated Expert in consultation with IANA assigns the next status  
4645 code in the appropriate class range as specified in Section 13. IANA will publish approved status code  
4646 registration specifications as separate files:

4647 ftp.isi.edu/iana/assignments/ipp/status-codes/xxx-yyy.txt

4648 where "xxx-yyy" is the new operation status code keyword.

## 4649 6.7 Registration of MIME types/sub-types for document-formats

4650 The "document-format" attribute's syntax is 'mimeMediaType'. This means that valid values are Internet  
4651 Media Types (see Section 4.1.9). RFC 2045 [RFC2045] defines the syntax for valid Internet media  
4652 types. IANA is the registry for all Internet media types.

## 4653 6.8 Registration of charsets for use in 'charset' attribute values

4654 The "attributes-charset" attribute's syntax is 'charset'. This means that valid values are charsets names.  
4655 When a charset in the IANA registry has more than one name (alias), the name labeled as "(preferred  
4656 MIME name)", if present, MUST be used (see Section 4.1.7). IANA is the registry for charsets  
4657 following the procedures of [RFC2278].

## 4658 7. Internationalization Considerations

4659 Some of the attributes have values that are text strings and names which are intended for human  
4660 understanding rather than machine understanding (see the 'text' and 'name' attribute syntaxes in Sections  
4661 4.1.1 and 4.1.2).

4662 In each operation request, the client

- 4663 - identifies the charset and natural language of the request which affects each supplied 'text' and  
4664 'name' attribute value, and  
4665 - requests the charset and natural language for attributes returned by the IPP object in operation  
4666 responses (as described in Section 3.1.4.1).  
4667

4668 In addition, the client MAY separately and individually identify the Natural Language Override of a  
4669 supplied 'text' or 'name' attribute using the 'textWithLanguage' and 'nameWithLanguage' technique  
4670 described section 4.1.1.2 and 4.1.2.2 respectively.

4671 All IPP objects MUST support the UTF-8 ~~[RFC2044]~~[RFC2279] charset in all 'text' and 'name' attributes  
4672 supported. If an IPP object supports more than the UTF-8 charset, the object MUST convert between  
4673 them in order to return the requested charset to the client according to Section 3.1.4.2. If an IPP object  
4674 supports more than one natural language, the object SHOULD return 'text' and 'name' values in the  
4675 natural language requested where those values are generated by the Printer (see Section 3.1.4.1).

4676 For Printers that support multiple charsets and/or multiple natural languages in 'text' and 'name'  
4677 attributes, different jobs may have been submitted in differing charsets and/or natural languages. All  
4678 responses MUST be returned in the charset requested by the client. However, the Get-Jobs operation  
4679 uses the 'textWithLanguage' and 'nameWithLanguage' mechanism to identify the differing natural  
4680 languages with each job attribute returned.

4681 The Printer object also has configured charset and natural language attributes. The client can query the  
4682 Printer object to determine the list of charsets and natural languages supported by the Printer object and  
4683 what the Printer object's configured values are. See the "charset-configured", "charset-supported",  
4684 "natural-language-configured", and "generated-natural-language-supported" Printer description attributes  
4685 for more details.

4686 The "charset-supported" attributed identifies the supported charsets. If a charset is supported, the IPP  
4687 object MUST be capable of converting to and from that charset into any other supported charset. In  
4688 many cases, an IPP object will support only one charset and it MUST be the UTF-8 charset.

4689 The "charset-configured" attribute identifies the one supported charset which is the native charset given  
4690 the current configuration of the IPP object (administrator defined).

4691 The "generated-natural-language-supported" attribute identifies the set of supported natural languages  
4692 for generated messages; it is not related to the set of natural languages that must be accepted for client  
4693 supplied 'text' and 'name' attributes. For client supplied 'text' and 'name' attributes, an IPP object MUST  
4694 accept ALL supplied natural languages. Just because a Printer object is currently configured to support  
4695 'en-us' natural language does not mean that the Printer object should reject a job if the client supplies a  
4696 job name that is in 'fr-ca'.

4697 The "natural-language-configured" attribute identifies the one supported natural language for generated  
4698 messages which is the native natural language given the current configuration of the IPP object  
4699 (administrator defined).

4700 Attributes of type 'text' and 'name' are populated from different sources. These attributes can be  
4701 categorized into following groups (depending on the source of the attribute):

- 4702 1. Some attributes are supplied by the client (e.g., the client supplied "job-name", "document-name",  
4703 and "requesting-user-name" operation attributes along with the corresponding Job object's "job-  
4704 name" and "job-originating-user-name" attributes). The IPP object MUST accept these attributes  
4705 in any natural language no matter what the set of supported languages for generated messages
- 4706 2. Some attributes are supplied by the system administrator (e.g., the Printer object's "printer-name"  
4707 and "printer-location" attributes). These too can be in any natural language. If the natural  
4708 language for these attributes is different than what a client requests, then they must be reported  
4709 using the Natural Language Override mechanism.
- 4710 3. Some attributes are supplied by the device manufacturer (e.g., the Printer object's "printer-make-  
4711 and-model" attribute). These too can be in any natural language. If the natural language for  
4712 these attributes is different than what a client requests, then they must be reported using the  
4713 Natural Language Override mechanism.
- 4714 4. Some attributes are supplied by the operator (e.g., the Job object's "job-message-from-operator"  
4715 attribute). These too can be in any natural language. If the natural language for these attributes is  
4716 different than what a client requests, then they must be reported using the Natural Language  
4717 Override mechanism.
- 4718 5. Some attributes are generated by the IPP object (e.g., the Job object's "job-state-message"  
4719 attribute, the Printer object's "printer-state-message" attribute, and the "status-message" operation  
4720 attribute). These attributes can only be in one of the "generated-natural-language-supported"  
4721 natural languages. If a client requests some natural language for these attributes other than one of  
4722 the supported values, the IPP object SHOULD respond using the value of the "natural-language-  
4723 configured" attribute (using the Natural Language Override mechanism if needed).

4725 The 'text' and 'name' attributes specified in this version of this document (additional ones will be  
4726 registered according to the procedures in Section 1.1) are:

Attributes	Source
Operation Attributes:	
job-name (name)	client
document-name (name)	client
requesting-user-name (name)	client
status-message	Job or Printer object
Job Template Attributes:	
job-hold-until (keyword   name)	client matches administrator-configured
job-hold-until-default (keyword   name)	client matches administrator-configured
job-hold-until-supported (keyword   name)	client matches administrator-configured
job-sheets (keyword   name)	client matches administrator-configured
job-sheets-default (keyword   name)	client matches administrator-configured
job-sheets-supported (keyword   name)	client matches administrator-configured
media (keyword   name)	client matches administrator-configured

	media-default (keyword   name)	client matches administrator-configured
	media-supported (keyword   name)	client matches administrator-configured
	media-ready (keyword   name)	client matches administrator-configured
Job Description Attributes:		
	job-name (name)	client or Printer object
	job-originating-user-name (name)	Printer object
	job-state-message (text)	Job or Printer object
	output-device-assigned (name(127))	administrator
	job-message-from-operator (text(127))	operator
Printer Description Attributes:		
	printer-name (name(127))	administrator
	printer-location (text(127))	administrator
	printer-info (text(127))	administrator
	printer-make-and-model (text(127))	administrator or manufacturer
	printer-state-message (text)	Printer object
	printer-message-from-operator (text(127))	operator

4727 8. Security Considerations

4728 ~~Some IPP objects MAY be deployed over protocol stacks that support Secure Socket Layer Version 3~~  
 4729 ~~(SSL3) [SSL]. Note: SSL3 is not an IETF standards track specification. Other IPP objects MAY be~~  
 4730 ~~deployed over protocol stacks that do not support SSL3. Some IPP objects MAY be deployed over both~~  
 4731 ~~types of protocol stacks. Those IPP objects that support SSL3, are capable of supporting mutual~~  
 4732 ~~authentication as well as privacy of messages via multiple encryption schemes. An important point~~  
 4733 ~~about security related information for SSL3 access to an IPP object, is that the security related~~  
 4734 ~~parameters (authentication, encryption keys, etc.) are "out of band" to the actual IPP protocol.~~

4735 ~~An IPP object that does not support SSL3 MAY elect to support a transport layer that provides other~~  
 4736 ~~security mechanisms. For example, in a mapping of IPP over HTTP/1.1 [IPP-PRO], if the IPP object~~  
 4737 ~~does not support SSL3, HTTP still allows for client authentication using Digest Access Authentication~~  
 4738 ~~(DAA) [RFC2069].~~

4739 It is difficult to anticipate the security risks that might exist in any given IPP environment. For example,  
 4740 if IPP is used within a given corporation over a private network, the risks of exposing document data  
 4741 may be low enough that the corporation will choose not to use encryption on that data. However, if the  
 4742 connection between the client and the IPP object is over a public network, the client may wish to protect  
 4743 the content of the information during transmission through the network with encryption.

4744 Furthermore, the value of the information being printed may vary from one IPP environment to the next.  
 4745 Printing payroll checks, for example, would have a different value than printing public information from  
 4746 a file. There is also the possibly of denial-of-service attacks, but denial-of-service attacks against  
 4747 printing resources are not well understood and there is no published precedents regarding this scenario.

4748 Once the authenticated identity of the requester has been supplied to the IPP object, the object uses that  
4749 identity to enforce any authorization policy that might be in place. For example, one site's policy might  
4750 be that only the job owner is allowed to cancel a job. The details and mechanisms to set up a particular  
4751 access control policy are not part of ~~IPP/1.0, IPP/1.1~~, and must be established via some other type of  
4752 administrative or access control framework. However, there are operation status codes that allow an IPP  
4753 server to return information back to a client about any potential access control violations for an IPP  
4754 object.

4755 During a create operation, the client's identity is recorded in the Job object in an implementation-defined  
4756 attribute. This information can be used to verify a client's identity for subsequent operations on that Job  
4757 object in order to enforce any access control policy that might be in effect. See section 8.3 below for  
4758 more details.

4759 Since the security levels or the specific threats that any given IPP system administrator may be  
4760 concerned with cannot be anticipated, IPP MUST be capable of operating with different security  
4761 mechanisms and security policies as required by the individual installation. Security policies might vary  
4762 from very strong, to very weak, to none at all, and corresponding security mechanisms will be required.  
4763 ~~SSL3 supports the type of negotiated levels of security required by most, if not all, potential IPP~~  
4764 ~~environments. IPP environments that require no security can elect to deploy IPP objects that do not~~  
4765 ~~utilize the optional SSL3 security mechanisms.~~

## 4766 8.1 Security Scenarios

4767 The following sections describe specific security attacks for IPP environments. Where examples are  
4768 provided they should be considered illustrative of the environment and not an exhaustive set. Not all of  
4769 these environments will necessarily be addressed in initial implementations of IPP.

### 4770 8.1.1 Client and Server in the Same Security Domain

4771 This environment is typical of internal networks where traditional office workers print the output of  
4772 personal productivity applications on shared work-group printers, or where batch applications print their  
4773 output on large production printers. Although the identity of the user may be trusted in this environment,  
4774 a user might want to protect the content of a document against such attacks as eavesdropping, replaying  
4775 or tampering.

### 4776 8.1.2 Client and Server in Different Security Domains

4777 Examples of this environment include printing a document created by the client on a publicly available  
4778 printer, such as at a commercial print shop; or printing a document remotely on a business associate's  
4779 printer. This latter operation is functionally equivalent to sending the document to the business associate  
4780 as a facsimile. Printing sensitive information on a Printer in a different security domain requires strong  
4781 security measures. In this environment authentication of the printer is required as well as protection  
4782 against unauthorized use of print resources. Since the document crosses security domains, protection  
4783 against eavesdropping and document tampering are also required. It will also be important in this  
4784 environment to protect Printers against "spamming" and malicious document content.

4785 8.1.3 Print by Reference

4786 When the document is not stored on the client, printing can be done by reference. That is, the print  
4787 request can contain a reference, or pointer, to the document instead of the actual document itself (see  
4788 sections 3.2.2 and 3.3.2). Standard methods currently do not exist for remote entities to "assume" the  
4789 credentials of a client for forwarding requests to a 3rd party. It is anticipated that Print-By-Reference will  
4790 be used to access "public" documents and that sophisticated methods for authenticating "proxies" ~~will~~  
4791 ~~not be specified for version 1 of IPP.~~is not specified in this document.

4792 1.28.2 URIs for SSL3 and non-SSL3 Access in Operation, Job, and Printer attributes

4793 ~~As described earlier, an IPP object can support SSL3 access, non-SSL3 access, or both.~~ The "printer-uri-  
4794 supported" attribute contains the Printer object's URI(s). Its companion attribute, "uri-security-  
4795 supported", identifies the security mechanism used for each URI listed in the "printer-uri-supported"  
4796 attribute. For each Printer operation request, a client MUST supply only one URI in the "printer-uri"  
4797 operation attribute. In other words, even though the Printer supports more than one URI, the client only  
4798 interacts with the Printer object using one of its URIs. This duality is not needed for Job objects, since  
4799 the Printer objects is the factory for Job objects, and the Printer object will generate the correct URI for  
4800 new Job objects depending on the Printer object's security configuration.

4801 8.3 URIs for each authentication mechanisms~~The "requesting-user-name" (name(MAX)) Operation~~  
4802 Attribute

4803 Each URI has an authentication mechanism associated with it. If the URI is the ith element of "printer-  
4804 uri-supported", then authentication mechanism is the "i th" element of "uri-authentication-supported".  
4805 For a list of possible authentication mechanisms, see section 4.4.2.

4806 The Printer object uses an authentication mechanism to determine the name of the user performing an  
4807 operation. This user is called the "authenticated user". The credibility of authentication depends on the  
4808 mechanism that the Printer uses to obtain the user's name. When the authentication mechanism is 'none',  
4809 all authenticated users are "anonymous".

4810 During job creation operations, the Printer initializes the value of the "job-originating-user-name"  
4811 attribute to be the authenticated user. The authenticated user in this case is called the "job-owner".

4812 If an implementation can be configured to support more than one authentication mechanism, then it  
4813 MUST implement rules for determining equality of authenticated user names which have been  
4814 authenticated via different authentication mechanisms. One possible policy is that identical names that  
4815 are authenticated via different mechanism are different. For example, a user can cancel his job only if he  
4816 uses the same authentication mechanism for both Cancel-Job and Print-Job. Another policy is that  
4817 identical names that are authenticated via different mechanism are the same if the authentication  
4818 mechanism for the later operation is not less strong than the authentication mechanism for the earlier job  
4819 creation operation. For example, a user can cancel his job only if he uses the same or stronger  
4820 authentication mechanism for Cancel-Job and Print-Job. With this second policy a job submitted via

4821 ~~'requesting-user-name' authentication could be cancelled via 'digest' authentication. With the first policy,~~  
4822 ~~the job could not be cancelled in this way.~~

4823 ~~A client is able to determine the authentication mechanism used to create a job. It is the  $i$ th value of the~~  
4824 ~~Printer's "uri-authentication-supported" attribute, where  $i$  is the index of the element of the Printer's~~  
4825 ~~"uri-printer-supported" attribute equal to the job's "job-printer-uri" attribute.~~

4826 ~~Each operation MUST specify the user who is performing the operation in both of the following two~~  
4827 ~~ways:~~

4828 ~~1.31) via the REQUIRED "requesting-user-name" operation attribute that a client SHOULD supply in all~~  
4829 ~~operations. The client MUST obtain the value for this attribute from an environmental or network login~~  
4830 ~~name for the user, rather than allowing the user to supply any value. If the client does not supply a value~~  
4831 ~~for "requesting-user-name", the printer MUST assume that the client is supplying some anonymous~~  
4832 ~~name, such as "anonymous".~~

4833 ~~2) via an authentication mechanism of the underlying transport which may be configured to give no~~  
4834 ~~authentication information.~~

4835

4836 ~~There are six cases to consider:~~

- 4837 ~~a) the authentication mechanism gives no information, and the client doesn't specify "requesting-~~  
4838 ~~user-name".~~
- 4839 ~~b) the authentication mechanism gives no information, but the client specifies "requesting-user-~~  
4840 ~~name".~~
- 4841 ~~c) the authentication mechanism specifies a user which has no human readable representation, and~~  
4842 ~~the client doesn't specify "requesting-user-name".~~
- 4843 ~~d) the authentication mechanism specifies a user which has no human readable representation, but~~  
4844 ~~the client specifies "requesting-user-name".~~
- 4845 ~~e) the authentication mechanism specifies a user which has a human readable representation. The~~  
4846 ~~Printer object ignores the "requesting-user-name".~~
- 4847 ~~f) the authentication mechanism specifies a user who is trusted and whose name means that the~~  
4848 ~~value of the "requesting-user-name", which MUST be present, is treated as the authenticated~~  
4849 ~~name.~~

4850

4851 ~~Note: Case "f" is intended for a tightly coupled gateway and server to work together so that the "user"~~  
4852 ~~name is able to be that of the gateway client and not that of the gateway. Because most, if not all, system~~  
4853 ~~vendors will initially implement IPP via a gateway into their existing print system, this mechanism is~~  
4854 ~~necessary unless the authentication mechanism allows a gateway (client) to act on behalf of some other~~  
4855 ~~client.~~

4856 ~~The user name has two forms: one that is human readable: it is held in the REQUIRED "job-~~  
4857 ~~originating-user-name" Job Description attribute which is set during the job creation operations. It is~~  
4858 ~~used for presentation only, such as returning in queries or printing on start sheets~~

4859 ~~—one for authorization: it is held in an undefined (by IPP) Job object attribute which is set by the job~~  
4860 ~~creation operation. It is used to authorize other operations, such as Send Document, Send URI,~~  
4861 ~~Cancel Job, to determine the user when the "my jobs" attribute is specified with Get Jobs, and to~~  
4862 ~~limit what attributes and values to return with Get Job Attributes and Get Jobs.~~

4863

4864 ~~The human readable user name:~~

4865 ~~—is the value of the "requesting user name" for cases b, d and f.~~  
4866 ~~—comes from the authentication mechanism for case e~~  
4867 ~~—is some anonymous name, such as "anonymous" for cases a and c.~~

4868

4869 ~~The user name used for authorization:~~

4870 ~~—is the value of the "requesting user name" for cases b and f.~~  
4871 ~~—comes from the authentication mechanism for cases c, d and e~~  
4872 ~~—is some anonymous name, such as "anonymous" for case a.~~

4873

4874 ~~The essence of these rules for resolving conflicting sources of user names is that a printer~~  
4875 ~~implementation is free to pick either source as long as it achieves consistent results. That is, if a user~~  
4876 ~~uses the same path for a series of requests, the requests MUST appear to come from the same user from~~  
4877 ~~the standpoint of both the human readable user name and the user name for authorization. This rule~~  
4878 ~~MUST continue to apply even if a request could be authenticated by two or more mechanisms. It doesn't~~  
4879 ~~matter which of several authentication mechanisms a Printer uses as long as it achieves consistent~~  
4880 ~~results. If a client uses more than one authentication mechanism, it is recommended that an~~  
4881 ~~administrator make all credentials resolve to the same user and user name as much as possible.~~

4882

#### 4883 8.4 Restricted Queries

4884 In many IPP operations, a client supplies a list of attributes to be returned in the response. For security  
4885 reasons, an IPP object may be configured not to return all attributes (or all values) that a client requests.  
4886 The job attributes returned MAY depend on whether the requesting user is the same as the user that  
4887 submitted the job. The IPP object MAY even return none of the requested attributes. In such cases, the  
4888 status returned is the same as if the object had returned all requested attributes. The client cannot tell by  
4889 such a response whether the requested attribute was present or absent on the object.

#### 4890 8.5 Operations performed by operators and system administrators

4891 For the three printer operations Pause-Printer, Resume-Printer, and Purge-Jobs (see sections 3.2.7, 3.2.8  
4892 and 3.2.9), the requesting user is intended to be an operator or administrator of the Printer object (see  
4893 section 1). For operations on jobs, the requesting user is intended to be the job owner or may be an  
4894 operator or administrator of the Printer object. The means for authorizing an operator or administrator of  
4895 the Printer object are not specified in this document.

4896 8.6 Queries on jobs submitted using non-IPP protocols

4897 If the device that an IPP Printer is representing is able to accept jobs using other job submission  
4898 protocols in addition to IPP, it is RECOMMENDED that such an implementation at least allow such  
4899 "foreign" jobs to be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an  
4900 implementation NEED NOT support all of the same IPP job attributes as for IPP jobs. The IPP object  
4901 returns the 'unknown' out-of-band value for any requested attribute of a foreign job that is supported for  
4902 IPP jobs, but not for foreign jobs.

4903 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such  
4904 "foreign jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-Attributes  
4905 and Cancel-Job. Such an implementation also needs to deal with the problem of authentication of such  
4906 foreign jobs. One approach would be to treat all such foreign jobs as belonging to users other than the  
4907 user of the IPP client. Another approach would be for the foreign job to belong to 'anonymous'. Only if  
4908 the IPP client has been authenticated as an operator or administrator of the IPP Printer object, could the  
4909 foreign jobs be queried by an IPP request. Alternatively, if the security policy is to allow users to query  
4910 other users' jobs, then the foreign jobs would also be visible to an end-user IPP client using Get-Jobs and  
4911 Get-Job-Attributes.

4912 ~~8.6 IPP Security Application Profile for SSL3~~

4913 ~~The IPP application profile for SSL3 follows the "Secure Socket Layer" requirement as documented in~~  
4914 ~~the SSL3 specification [SSL]. For interoperability, the SSL3 cipher suites are:~~

4915 ~~SSL\_RSA\_WITH\_RC4\_128\_MD5~~  
4916 ~~SSL\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA~~  
4917 ~~SSL\_RSA\_WITH\_DES\_CBC\_SHA~~  
4918 ~~SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5~~  
4919 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5~~  
4920 ~~SSL\_RSA\_WITH\_NULL\_MD5~~

4921 ~~Client implementations MUST NOT assume any other cipher suites are supported by an IPP Printer~~  
4922 ~~object.~~

4923 ~~If a conforming IPP object supports SSL3, it MUST implement and support the cipher suites listed~~  
4924 ~~above and MAY support additional cipher suites.~~

4925 ~~A conforming IPP client SHOULD support SSL3 including the cipher suites listed above. A conforming~~  
4926 ~~IPP client MAY support additional cipher suites.~~

4927 ~~It is possible that due to certain government export restrictions some non-compliant versions of this~~  
4928 ~~extension could be deployed. Implementations wishing to inter-operate with such non-compliant~~  
4929 ~~versions MAY offer the SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5 and~~  
4930 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5 mechanisms. However, since 40-bit ciphers are~~

4931 ~~known to be vulnerable to attack by current technology, any client which activates a 40 bit cipher MUST~~  
4932 ~~NOT indicate to the user that the connection is completely secure from eavesdropping.~~

5185 11. Formats for IPP Registration Proposals

5186 In order to propose an IPP extension for registration, the proposer must submit an application to IANA  
5187 by email to "iana@iana.org" or by filling out the appropriate form on the IANA web pages  
5188 (<http://www.iana.org>). This section specifies the required information and the formats for proposing  
5189 registrations of extensions to IPP as provided in Section 6 for:

5190

- 5191 1. type2 'keyword' attribute values
- 5192 2. type3 'keyword' attribute values
- 5193 3. type2 'enum' attribute values
- 5194 4. type3 'enum' attribute values
- 5195 5. attributes
- 5196 6. attribute syntaxes
- 5197 7. operations
- 5198 8. status codes

5199 11.1 Type2 keyword attribute values registration

5200 Type of registration: type2 keyword attribute value

5201 Name of attribute to which this keyword specification is to be added:

5202 Proposed keyword name of this keyword value:

5203 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5204 Name of proposer:

5205 Address of proposer:

5206 Email address of proposer:

5207

5208 Note: For type2 keywords, the Designated Expert will be the point of contact for the approved  
5209 registration specification, if any maintenance of the registration specification is needed.

5210 11.2 Type3 keyword attribute values registration

5211 Type of registration: type3 keyword attribute value

5212 Name of attribute to which this keyword specification is to be added:

5213 Proposed keyword name of this keyword value:

5214 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5215 Name of proposer:

5216 Address of proposer:

5217 Email address of proposer:

5218

5219 Note: For type3 keywords, the proposer will be the point of contact for the approved registration  
5220 specification, if any maintenance of the registration specification is needed.

5221 11.3 Type2 enum attribute values registration

5222 Type of registration: type2 enum attribute value

5223 Name of attribute to which this enum specification is to be added:  
5224 Keyword symbolic name of this enum value:  
5225 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5226 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5227 Name of proposer:  
5228 Address of proposer:  
5229 Email address of proposer:  
5230  
5231 Note: For type2 enums, the Designated Expert will be the point of contact for the approved registration  
5232 specification, if any maintenance of the registration specification is needed.

#### 5233 11.4 Type3 enum attribute values registration

5234 Type of registration: type3 enum attribute value  
5235 Name of attribute to which this enum specification is to be added:  
5236 Keyword symbolic name of this enum value:  
5237 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5238 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5239 Name of proposer:  
5240 Address of proposer:  
5241 Email address of proposer:  
5242  
5243 Note: For type3 enums, the proposer will be the point of contact for the approved registration  
5244 specification, if any maintenance of the registration specification is needed.

#### 5245 11.5 Attribute registration

5246 Type of registration: attribute  
5247 Proposed keyword name of this attribute:  
5248 Types of attribute (Operation, Job Template, Job Description, Printer Description):  
5249 Operations to be used with if the attribute is an operation attribute:  
5250 Object (Job, Printer, etc. if bound to an object):  
5251 Attribute syntax(es) (include 1setOf and range as in Section 4.2):  
5252 If attribute syntax is 'keyword' or 'enum', is it type2 or type3:  
5253 If this is a Printer attribute, MAY the value returned depend on "document-format" (See Section 6.2):  
5254 If this is a Job Template attribute, how does its specification depend on the value of the "multiple-  
5255 document-handling" attribute:  
5256 Specification of this attribute (follow the style of IPP Model Section 4.2):  
5257 Name of proposer:  
5258 Address of proposer:  
5259 Email address of proposer:  
5260  
5261 Note: For attributes, the IPP Designated Expert will be the point of contact for the approved registration  
5262 specification, if any maintenance of the registration specification is needed.

5263 11.6 Attribute Syntax registration

5264 Type of registration: attribute syntax

5265 Proposed name of this attribute syntax:

5266 Type of attribute syntax (integer, octetString, character-string, see [IPP-PRO]):

5267 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5268 Specification of this attribute (follow the style of IPP Model Section 4.1):

5269 Name of proposer:

5270 Address of proposer:

5271 Email address of proposer:

5272

5273 Note: For attribute syntaxes, the IPP Designated Expert will be the point of contact for the approved

5274 registration specification, if any maintenance of the registration specification is needed.

5275 11.7 Operation registration

5276 Type of registration: operation

5277 Proposed name of this operation:

5278 Numeric operation-id value (to be assigned by the IPP Designated Expert in consultation with IANA):

5279 Object Target (Job, Printer, etc. that operation is upon):

5280 Specification of this attribute (follow the style of IPP Model Section 3):

5281 Name of proposer:

5282 Address of proposer:

5283 Email address of proposer:

5284

5285 Note: For operations, the IPP Designated Expert will be the point of contact for the approved

5286 registration specification, if any maintenance of the registration specification is needed.

5287 11.8 Attribute Group registration

5288 Type of registration: attribute group

5289 Proposed name of this attribute group:

5290 Numeric tag according to [IPP-PRO] (to be assigned by the IPP Designated Expert in consultation with  
5291 IANA):

5292 Operation requests and group number for each operation in which the attribute group occurs:

5293 Operation responses and group number for each operation in which the attribute group occurs:

5294 Specification of this attribute group (follow the style of IPP Model Section 3):

5295 Name of proposer:

5296 Address of proposer:

5297 Email address of proposer:

5298

5299 Note: For attribute groups, the IPP Designated Expert will be the point of contact for the approved

5300 registration specification, if any maintenance of the registration specification is needed.

5301 11.9 Status code registration

5302 Type of registration: status code

5303 Keyword symbolic name of this status code value:

5304 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5305 Operations that this status code may be used with:

5306 Specification of this status code (follow the style of IPP Model Section 13 APPENDIX B: Status Codes  
5307 and Suggested Status Code Messages):

5308 Name of proposer:

5309 Address of proposer:

5310 Email address of proposer:

5311

5312 Note: For status codes, the Designated Expert will be the point of contact for the approved registration  
5313 specification, if any maintenance of the registration specification is needed.

5314 12. APPENDIX A: Terminology

5315 This specification uses the terminology defined in this section.

5316 12.1 Conformance Terminology

5317 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT",  
5318 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in  
5319 RFC 2119 [RFC2119].

5320 12.1.1 NEED NOT

5321 This term is not included in RFC 2119. The verb "NEED NOT" indicates an action that the subject of  
5322 the sentence does not have to implement in order to claim conformance to the standard. The verb  
5323 "NEED NOT" is used instead of "MAY NOT" since "MAY NOT" sounds like a prohibition.

5324 12.2 Model Terminology

5325 12.2.1 Keyword

5326 Keywords are used within this document as identifiers of semantic entities within the abstract model (see  
5327 section 4.1.2.3). Attribute names, some attribute values, attribute syntaxes, and attribute group names  
5328 are represented as keywords.

5329 12.2.2 Attributes

5330 An attribute is an item of information that is associated with an instance of an IPP object. An attribute  
5331 consists of an attribute name and one or more attribute values. Each attribute has a specific attribute  
5332 syntax. All object attributes are defined in section 4 and all operation attributes are defined in section 3.

5333 Job Template Attributes are described in section 4.2. The client optionally supplies Job Template  
5334 attributes in a create request (operation requests that create Job objects). The Printer object has  
5335 associated attributes which define supported and default values for the Printer.

5336 12.2.2.1 Attribute Name

5337 Each attribute is uniquely identified in this document by its attribute name. An attribute name is a  
5338 keyword. The keyword attribute name is given in the section header describing that attribute. In running  
5339 text in this document, attribute names are indicated inside double quotation marks (") where the  
5340 quotation marks are not part of the keyword itself.

5341 12.2.2.2 Attribute Group Name

5342 Related attributes are grouped into named groups. The name of the group is a keyword. The group  
5343 name may be used in place of naming all the attributes in the group explicitly. Attribute groups are  
5344 defined in section 3.

5345 12.2.2.3 Attribute Value

5346 Each attribute has one or more values. Attribute values are represented in the syntax type specified for  
5347 that attribute. In running text in this document, attribute values are indicated inside single quotation  
5348 marks ('), whether their attribute syntax is keyword, integer, text, etc. where the quotation marks are not  
5349 part of the value itself.

5350 12.2.2.4 Attribute Syntax

5351 Each attribute is defined using an explicit syntax type. In this document, each syntax type is defined as a  
5352 keyword with specific meaning. The ~~Encoding and Transport~~ "Encoding and Transport" document [IPP-  
5353 PRO] indicates the actual "on-the-wire" encoding rules for each syntax type. Attribute syntax types are  
5354 defined in section 4.1.

5355 12.2.3 Supports

5356 By definition, a Printer object supports an attribute only if that Printer object responds with the  
5357 corresponding attribute populated with some value(s) in a response to a query for that attribute. A  
5358 Printer object supports an attribute value if the value is one of the Printer object's "supported values"  
5359 attributes. The device behind a Printer object may exhibit a behavior that corresponds to some IPP  
5360 attribute, but if the Printer object, when queried for that attribute, doesn't respond with the attribute, then  
5361 as far as IPP is concerned, that implementation does not support that feature. If the Printer object's "xxx-

5362 supported" attribute is not populated with a particular value (even if that value is a legal value for that  
5363 attribute), then that Printer object does not support that particular value.

5364 A conforming implementation MUST support all REQUIRED attributes. However, even for  
5365 REQUIRED attributes, conformance to IPP does not mandate that all implementations support all  
5366 possible values representing all possible job processing behaviors and features. For example, if a given  
5367 instance of a Printer supports only certain document formats, then that Printer responds with the  
5368 "document-format-supported" attribute populated with a set of values, possibly only one, taken from the  
5369 entire set of possible values defined for that attribute. This limited set of values represents the Printer's  
5370 set of supported document formats. Supporting an attribute and some set of values for that attribute  
5371 enables IPP end users to be aware of and make use of those features associated with that attribute and  
5372 those values. If an implementation chooses to not support an attribute or some specific value, then IPP  
5373 end users would have no ability to make use of that feature within the context of IPP itself. However,  
5374 due to existing practice and legacy systems which are not IPP aware, there might be some other  
5375 mechanism outside the scope of IPP to control or request the "unsupported" feature (such as embedded  
5376 instructions within the document data itself).

5377 For example, consider the "finishings-supported" attribute.

- 5378 1) If a Printer object is not physically capable of stapling, the "finishings-supported" attribute MUST  
5379 NOT be populated with the value of 'staple'.
- 5380 2) A Printer object is physically capable of stapling, however an implementation chooses not to  
5381 support stapling in the IPP "finishings" attribute. In this case, 'staple' MUST NOT be a value in  
5382 the "finishings-supported" Printer object attribute. Without support for the value 'staple', an IPP  
5383 end user would have no means within the protocol itself to request that a Job be stapled.  
5384 However, an existing document data formatter might be able to request that the document be  
5385 stapled directly with an embedded instruction within the document data. In this case, the IPP  
5386 implementation does not "support" stapling, however the end user is still able to have some  
5387 control over the stapling of the completed job.
- 5388 3) A Printer object is physically capable of stapling, and an implementation chooses to support  
5389 stapling in the IPP "finishings" attribute. In this case, 'staple' MUST be a value in the "finishings-  
5390 supported" Printer object attribute. Doing so, would enable end users to be aware of and make  
5391 use of the stapling feature using IPP attributes.

5392

5393 Even though support for Job Template attributes by a Printer object is OPTIONAL, it is  
5394 RECOMMENDED that if the device behind a Printer object is capable of realizing any feature or  
5395 function that corresponds to an IPP attribute and some associated value, then that implementation  
5396 SHOULD support that IPP attribute and value.

5397 The set of values in any of the supported value attributes is set (populated) by some administrative  
5398 process or automatic sensing mechanism that is outside the scope of ~~IPP~~this IPP/1.1 document. For  
5399 administrative policy and control reasons, an administrator may choose to make only a subset of possible  
5400 values visible to the end user. In this case, the real output device behind the IPP Printer abstraction may  
5401 be capable of a certain feature, however an administrator is specifying that access to that feature not be  
5402 exposed to the end user through the IPP protocol. Also, since a Printer object may represent a logical  
5403 print device (not just a physical device) the actual process for supporting a value is undefined and left up

5404 to the implementation. However, if a Printer object supports a value, some manual human action may be  
5405 needed to realize the semantic action associated with the value, but no end user action is required.

5406 For example, if one of the values in the "finishings-supported" attribute is 'staple', the actual process  
5407 might be an automatic staple action by a physical device controlled by some command sent to the  
5408 device. Or, the actual process of stapling might be a manual action by an operator at an operator  
5409 attended Printer object.

5410 For another example of how supported attributes function, consider a system administrator who desires  
5411 to control all print jobs so that no job sheets are printed in order to conserve paper. To force no job  
5412 sheets, the system administrator sets the only supported value for the "job-sheets-supported" attribute to  
5413 'none'. In this case, if a client requests anything except 'none', the create request is rejected or the "job-  
5414 sheets" value is ignored (depending on the value of "ipp-attribute-fidelity"). To force the use of job  
5415 start/end sheets on all jobs, the administrator does not include the value 'none' in the "job-sheets-  
5416 supported" attribute. In this case, if a client requests 'none', the create request is rejected or the "job-  
5417 sheets" value is ignored (again depending on the value of "ipp-attribute-fidelity").

#### 5418 12.2.4 print-stream page

5419 A "print-stream page" is a page according to the definition of pages in the language used to express the  
5420 document data.

#### 5421 12.2.5 impression

5422 An "impression" is the image (possibly many print-stream pages in different configurations) imposed  
5423 onto a single media page.

### 5424 13. APPENDIX B: Status Codes and Suggested Status Code Messages

5425 This section defines status code enum keywords and values that are used to provide semantic  
5426 information on the results of an operation request. Each operation response **MUST** include a status  
5427 code. The response **MAY** also contain a status message that provides a short textual description of the  
5428 status. The status code is intended for use by automata, and the status message is intended for the human  
5429 end user. Since the status message is an **OPTIONAL** component of the operation response, an IPP  
5430 application (i.e., a browser, GUI, print driver or gateway) is **NOT REQUIRED** to examine or display the  
5431 status message, since it **MAY** not be returned to the application.

5432 The prefix of the status keyword defines the class of response as follows:

- 5433 "informational" - Request received, continuing process
- 5434 "successful" - The action was successfully received, understood, and accepted
- 5435 "redirection" - Further action must be taken in order to complete the request
- 5436 "client-error" - The request contains bad syntax or cannot be fulfilled
- 5437 "server-error" - The IPP object failed to fulfill an apparently valid request

5438

5439 As with type2 enums, IPP status codes are extensible. IPP clients are NOT REQUIRED to understand  
5440 the meaning of all registered status codes, though such understanding is obviously desirable. However,  
5441 IPP clients MUST understand the class of any status code, as indicated by the prefix, and treat any  
5442 unrecognized response as being equivalent to the first status code of that class, with the exception that an  
5443 unrecognized response MUST NOT be cached. For example, if an unrecognized status code of "client-  
5444 error-xxx-yyy" is received by the client, it can safely assume that there was something wrong with its  
5445 request and treat the response as if it had received a "client-error-bad-request" status code. In such cases,  
5446 IPP applications SHOULD present the OPTIONAL message (if present) to the end user since the  
5447 message is likely to contain human readable information which will help to explain the unusual status.  
5448 The name of the enum is the suggested status message for US English.

5449 The status code values range from 0x0000 to 0x7FFF. The value ranges for each status code class are as  
5450 follows:

5451 "successful" - 0x0000 to 0x00FF  
5452 "informational" - 0x0100 to 0x01FF  
5453 "redirection" - 0x0200 to 0x02FF  
5454 "client-error" - 0x0400 to 0x04FF  
5455 "server-error" - 0x0500 to 0x05FF  
5456

5457 The top half (128 values) of each range (0x0n40 to 0x0nFF, for n = 0 to 5) is reserved for private use  
5458 within each status code class. Values 0x0600 to 0x7FFF are reserved for future assignment and MUST  
5459 NOT be used.

## 5460 13.1 Status Codes

5461 Each status code is described below. Section 13.1.5.9 contains a table that indicates which status codes  
5462 apply to which operations. The Implementer's Guide [IPP-IIG] describe the suggested steps for  
5463 processing IPP attributes for all operations, including returning status codes.

### 5464 13.1.1 Informational

5465 This class of status code indicates a provisional response and is to be used for informational purposes  
5466 only.

5467 There are no status codes defined in ~~IPP/1.0~~ IPP/1.1 for this class of status code.

### 5468 13.1.2 Successful Status Codes

5469 This class of status code indicates that the client's request was successfully received, understood, and  
5470 accepted.

5471 13.1.2.1 successful-ok (0x0000)

5472 The request has succeeded and no request attributes were substituted or ignored. In the case of a  
5473 response to a create request, the 'successful-ok' status code indicates that the request was successfully  
5474 received and validated, and that the Job object has been created; it does not indicate that the job has been  
5475 processed. The transition of the Job object into the 'completed' state is the only indicator that the job has  
5476 been printed.

5477 13.1.2.2 successful-ok-ignored-or-substituted-attributes (0x0001)

5478 The request has succeeded, but some supplied (1) attributes were ignored or (2) unsupported values were  
5479 substituted with supported values or were ignored in order to perform the operation without rejecting it.  
5480 Unsupported attributes, attribute syntaxes, or values MUST be returned in the Unsupported Attributes  
5481 group of the response for all operations. There is an exception to this rule for the query operations: Get-  
5482 Printer-Attributes, Get-Jobs, and Get-Job-Attributes for the "requested-attributes" operation attribute  
5483 only. When the supplied values of the "requested-attributes" operation attribute are requesting attributes  
5484 that are not supported, the IPP object MAY, but is NOT REQUIRED to, return the "requested-attributes"  
5485 attribute in the Unsupported Attribute response group (with the unsupported values only). See section s  
5486 3.1.7 and 3.2.1.2.

5487 13.1.2.3 successful-ok-conflicting-attributes (0x0002)

5488 The request has succeeded, but some supplied attribute values conflicted with the values of other  
5489 supplied attributes. These conflicting values were either (1) substituted with (supported) values or (2)  
5490 the attributes were removed in order to process the job without rejecting it. Attributes or values which  
5491 conflict with other attributes and have been substituted or ignored MUST be returned in the Unsupported  
5492 Attributes group of the response for all operations as supplied by the client. See sections s 3.1.7 and  
5493 3.2.1.2.

5494 13.1.3 Redirection Status Codes

5495 This class of status code indicates that further action needs to be taken to fulfill the request.

5496 There are no status codes defined in ~~IPP/1.0~~ IPP/1.1 for this class of status code.

5497 13.1.4 Client Error Status Codes

5498 This class of status code is intended for cases in which the client seems to have erred. The IPP object  
5499 SHOULD return a message containing an explanation of the error situation and whether it is a temporary  
5500 or permanent condition.

5501 13.1.4.1 client-error-bad-request (0x0400)

5502 The request could not be understood by the IPP object due to malformed syntax (such as the value of a  
5503 fixed length attribute whose length does not match the prescribed length for that attribute - see the

5504 Implementer's Guide [IPP-IIG] ). The IPP application SHOULD NOT repeat the request without  
5505 modifications.

5506 13.1.4.2 client-error-forbidden (0x0401)

5507 The IPP object understood the request, but is refusing to fulfill it. Additional authentication information  
5508 or authorization credentials will not help and the request SHOULD NOT be repeated. This status code  
5509 is commonly used when the IPP object does not wish to reveal exactly why the request has been refused  
5510 or when no other response is applicable.

5511 13.1.4.3 client-error-not-authenticated (0x0402)

5512 The request requires user authentication. The IPP client may repeat the request with suitable  
5513 authentication information. If the request already included authentication information, then this status  
5514 code indicates that authorization has been refused for those credentials. If this response contains the  
5515 same challenge as the prior response, and the user agent has already attempted authentication at least  
5516 once, then the response message may contain relevant diagnostic information. This status codes reveals  
5517 more information than "client-error-forbidden".

5518 13.1.4.4 client-error-not-authorized (0x0403)

5519 The requester is not authorized to perform the request. Additional authentication information or  
5520 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is  
5521 used when the IPP object wishes to reveal that the authentication information is understandable,  
5522 however, the requester is explicitly not authorized to perform the request. This status codes reveals  
5523 more information than "client-error-forbidden" and "client-error-not-authenticated".

5524 13.1.4.5 client-error-not-possible (0x0404)

5525 This status code is used when the request is for something that can not happen. For example, there  
5526 might be a request to cancel a job that has already been canceled or aborted by the system. The IPP  
5527 client SHOULD NOT repeat the request.

5528 13.1.4.6 client-error-timeout (0x0405)

5529 The client did not produce a request within the time that the IPP object was prepared to wait. For  
5530 example, a client issued a Create-Job operation and then, after a long period of time, issued a Send-  
5531 Document operation and this error status code was returned in response to the Send-Document request  
5532 (see section 3.3.1). The IPP object might have been forced to clean up resources that had been held for  
5533 the waiting additional Documents. The IPP object was forced to close the Job since the client took too  
5534 long. The client SHOULD NOT repeat the request without modifications.

5535 13.1.4.7 client-error-not-found (0x0406)

5536 The IPP object has not found anything matching the request URI. No indication is given of whether the  
5537 condition is temporary or permanent. For example, a client with an old reference to a Job (a URI) tries  
5538 to cancel the Job, however in the mean time the Job might have been completed and all record of it at the  
5539 Printer has been deleted. This status code, 'client-error-not-found' is returned indicating that the  
5540 referenced Job can not be found. This error status code is also used when a client supplies a URI as a  
5541 reference to the document data in either a Print-URI or Send-URI operation, but the document can not be  
5542 found.

5543 In practice, an IPP application should avoid a not found situation by first querying and presenting a list  
5544 of valid Printer URIs and Job URIs to the end-user.

5545 13.1.4.8 client-error-gone (0x0407)

5546 The requested object is no longer available and no forwarding address is known. This condition should  
5547 be considered permanent. Clients with link editing capabilities should delete references to the request  
5548 URI after user approval. If the IPP object does not know or has no facility to determine, whether or not  
5549 the condition is permanent, the status code "client-error-not-found" should be used instead.

5550 This response is primarily intended to assist the task of maintenance by notifying the recipient that the  
5551 resource is intentionally unavailable and that the IPP object administrator desires that remote links to  
5552 that resource be removed. It is not necessary to mark all permanently unavailable resources as "gone" or  
5553 to keep the mark for any length of time -- that is left to the discretion of the IPP object administrator.

5554 13.1.4.9 client-error-request-entity-too-large (0x0408)

5555 The IPP object is refusing to process a request because the request entity is larger than the IPP object is  
5556 willing or able to process. An IPP Printer returns this status code when it limits the size of print jobs and  
5557 it receives a print job that exceeds that limit or when the attributes are so many that their encoding  
5558 causes the request entity to exceed IPP object capacity.

5559 13.1.4.10 client-error-request-value-too-long (0x0409)

5560 The IPP object is refusing to service the request because one or more of the client-supplied attributes has  
5561 a variable length value that is longer than the maximum length specified for that attribute. The IPP  
5562 object might not have sufficient resources (memory, buffers, etc.) to process (even temporarily),  
5563 interpret, and/or ignore a value larger than the maximum length. Another use of this error code is when  
5564 the IPP object supports the processing of a large value that is less than the maximum length, but during  
5565 the processing of the request as a whole, the object may pass the value onto some other system  
5566 component which is not able to accept the large value. For more details, see the Implementer's Guide  
5567 [IPP-IIG] .

5568 Note: For attribute values that are URIs, this rare condition is only likely to occur when a client has  
5569 improperly submitted a request with long query information (e.g. an IPP application allows an end-user  
5570 to enter an invalid URI), when the client has descended into a URI "black hole" of redirection (e.g., a

5571 redirected URI prefix that points to a suffix of itself), or when the IPP object is under attack by a client  
5572 attempting to exploit security holes present in some IPP objects using fixed-length buffers for reading or  
5573 manipulating the Request-URI.

5574 13.1.4.11 client-error-document-format-not-supported (0x040A)

5575 The IPP object is refusing to service the request because the document data is in a format, as specified in  
5576 the "document-format" operation attribute, that is not supported by the Printer object. This error is  
5577 returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this  
5578 status code, even if there are other Job Template attributes that are not supported as well, since this error  
5579 is a bigger problem than with Job Template attributes. See sections 3.1.7 and 3.2.1.1. Issue 11

5580 13.1.4.12 client-error-attributes-or-values-not-supported (0x040B)

5581 In a create request, if the Printer object does not support one or more attributes, attribute syntaxes, or  
5582 attribute values supplied in the request and the client supplied the "ipp-attributes-fidelity" operation  
5583 attribute with the 'true' value, the Printer object MUST return this status code. The Printer object MUST  
5584 also return in the Unsupported Attributes Group all the attributes and/or values supplied by the client  
5585 that are not supported. See section 3.1.7. Issue 11 For example, if the request indicates 'iso-a4' media,  
5586 but that media type is not supported by the Printer object. Or, if the client supplies an optional a Job  
5587 Template attribute and the attribute itself is not even supported by the Printer. If the "ipp-attribute-  
5588 fidelity" attribute is 'false', the Printer MUST ignore or substitute values for unsupported Job Template  
5589 attributes and values rather than reject the request and return this status code.

5590 For any operation where a client requests attributes (such as a Get-Jobs, Get-Printer-Attributes, or Get-  
5591 Job-Attributes operation), if the IPP object does not support one or more of the requested attributes, the  
5592 IPP object simply ignores the unsupported requested attributes and processes the request as if they had  
5593 not been supplied, rather than returning this status code. In this case, the IPP object MUST return the  
5594 'successful-ok-ignored-or-substituted-attributes' status code and MAY return the unsupported attributes  
5595 as values of the "requested-attributes" in the Unsupported Attributes Group (see section 13.1.2.2).

5596 13.1.4.13 client-error-uri-scheme-not-supported (0x040C)

5597 The type of the client supplied scheme of the client-supplied URI in a Print-URI or a Send-URI operation  
5598 is not supported. See section 3.1.7. Issue 11

5599 13.1.4.14 client-error-charset-not-supported (0x040D)

5600 For any operation, if the IPP Printer does not support the charset supplied by the client in the "attributes-  
5601 charset" operation attribute, the Printer MUST reject the operation and return this status and any 'text' or  
5602 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1). See section 3.1.7. Issue 11

5603 13.1.4.15 client-error-conflicting-attributes (0x040E)

5604 The request is rejected because some attribute values conflicted with the values of other attributes which  
5605 this specification does not permit to be substituted or ignored. The Printer object MUST also return in  
5606 the Unsupported Attributes Group the conflicting attributes supplied by the client. See sections 3.1.7  
5607 and 3.2.1.2. Issue 27

5608 13.1.4.16 client-error-compression-not-supported (0x040F) Issue 6

5609 The IPP object is refusing to service the request because the document data, as specified in the  
5610 "compression" operation attribute, is compressed in a way that is not supported by the Printer object.  
5611 This error is returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object  
5612 MUST return this status code, even if there are other Job Template attributes that are not supported as  
5613 well, since this error is a bigger problem than with Job Template attributes. Issue 6 See sections 3.1.7  
5614 and 3.2.1.1. Issue 11

5615 13.1.4.17 client-error-compression-error (0x0410) Issue 6

5616 The IPP object is refusing to service the request because the document data cannot be decompressed  
5617 when using the algorithm specified by the "compression" operation attribute. This error is returned  
5618 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status  
5619 code, even if there are Job Template attributes that are not supported as well, since this error is a bigger  
5620 problem than with Job Template attributes. See sections 3.1.7 and 3.2.1.1.

5621 13.1.4.18 client-error-document-format-error (0x0411) Issue 28

5622 The IPP object is refusing to service the request because Printer encountered an error in the document  
5623 data while interpreting it. This error is returned independent of the client-supplied "ipp-attribute-  
5624 fidelity". The Printer object MUST return this status code, even if there are Job Template attributes that  
5625 are not supported as well, since this error is a bigger problem than with Job Template attributes. See  
5626 sections 3.1.7 and 3.2.1.1.

5627 13.1.4.19 client-error-document-access-error (0x0412) Issue 35

5628 The IPP object is refusing to service the Print-URI or Send-URI request because Printer encountered an  
5629 access error while attempting to validate the accessibility or access the document data specified in the  
5630 "document-uri" operation attribute. This error is returned independent of the client-supplied "ipp-  
5631 attribute-fidelity". The Printer object MUST return this status code, even if there are Job Template  
5632 attributes that are not supported as well, since this error is a bigger problem than with Job Template  
5633 attributes. See section 3.1.7.

5634 13.1.5 Server Error Status Codes

5635 This class of status codes indicates cases in which the IPP object is aware that it has erred or is incapable  
5636 of performing the request. The IPP object SHOULD include a message containing an explanation of the  
5637 error situation, and whether it is a temporary or permanent condition.

5638 13.1.5.1 server-error-internal-error (0x0500)

5639 The IPP object encountered an unexpected condition that prevented it from fulfilling the request. This  
5640 error status code differs from "server-error-temporary-error" in that it implies a more permanent type of  
5641 internal error. It also differs from "server-error-device-error" in that it implies an unexpected condition  
5642 (unlike a paper-jam or out-of-toner problem which is undesirable but expected). This error status code  
5643 indicates that probably some knowledgeable human intervention is required.

5644 13.1.5.2 server-error-operation-not-supported (0x0501)

5645 The IPP object does not support the functionality required to fulfill the request. This is the appropriate  
5646 response when the IPP object does not recognize an operation or is not capable of supporting it. See  
5647 section 3.1.7. Issue 18

5648 13.1.5.3 server-error-service-unavailable (0x0502)

5649 The IPP object is currently unable to handle the request due to a temporary overloading or maintenance  
5650 of the IPP object. The implication is that this is a temporary condition which will be alleviated after  
5651 some delay. If known, the length of the delay may be indicated in the message. If no delay is given, the  
5652 IPP application should handle the response as it would for a "server-error-temporary-error" response. If  
5653 the condition is more permanent, the error status codes "client-error-gone" or "client-error-not-found"  
5654 could be used.

5655 13.1.5.4 server-error-version-not-supported (0x0503)

5656 The IPP object does not support, or refuses to support, the IPP protocol version that was ~~used in the~~  
5657 ~~request message.~~ supplied as the value of the "version-number" operation parameter in the request. The  
5658 IPP object is indicating that it is unable or unwilling to complete the request using the same major and  
5659 minor version number as supplied in the request other than with this error message. The response  
5660 ~~should~~ SHOULD contain a Message "status-message" attribute describing why that version is not  
5661 supported and what other versions are supported by that IPP object. See section 3.1.6.

5662 ~~A conforming IPP/1.0 client MUST specify the valid version ('1.0') on each request. A conforming~~  
5663 ~~IPP/1.0 object MUST NOT return this status code to a conforming IPP/1.0 client. An IPP object MUST~~  
5664 ~~return this status code to a non-conforming IPP client. The~~ The error response MUST identify in the  
5665 "version-number" operation ~~attribute~~ parameter the closest version number that the IPP object does  
5666 support. For example, if a client supplies version '1.0' and an IPP/1.1 object supports version '1.0', then  
5667 it MUST respond with version '1.0'. If the IPP/1.1 object does not support version '1.0', then it MUST  
5668 respond with this error code. Issue 36

5669 13.1.5.5 server-error-device-error (0x0504)

5670 A printer error, such as a paper jam, occurs while the IPP object processes a Print or Send operation.  
5671 The response contains the true Job Status (the values of the "job-state" and "job-state-reasons"  
5672 attributes). Additional information can be returned in the ~~optional~~OPTIONAL "job-state-message"  
5673 attribute value or in the OPTIONAL status message that describes the error in more detail. This error  
5674 status code is only returned in situations where the Printer is unable to accept the create request because  
5675 of such a device error. For example, if the Printer is unable to spool, and can only accept one job at a  
5676 time, the reason it might reject a create request is that the printer currently has a paper jam. In many  
5677 cases however, where the Printer object can accept the request even though the Printer has some error  
5678 condition, the 'successful-ok' status code will be returned. In such a case, the client would look at the  
5679 returned Job Object Attributes or later query the Printer to determine its state and state reasons.

5680 13.1.5.6 server-error-temporary-error (0x0505)

5681 A temporary error such as a buffer full write error, a memory overflow (i.e. the document data exceeds  
5682 the memory of the Printer), or a disk full condition, occurs while the IPP Printer processes an operation.  
5683 The client MAY try the unmodified request again at some later point in time with an expectation that the  
5684 temporary internal error condition may have been cleared. Alternatively, as an implementation option, a  
5685 Printer object MAY delay the response until the temporary condition is cleared so that no error is  
5686 returned.

5687 13.1.5.7 server-error-not-accepting-jobs (0x0506)

5688 A temporary error indicating that the Printer is not currently accepting jobs, because the administrator  
5689 has set the value of the Printer's "printer-is-not-accepting-jobs" attribute to 'false' (by means outside of  
5690 ~~IPP/1.0~~:the scope of this IPP/1.1 document).

5691 13.1.5.8 server-error-busy (0x0507)

5692 A temporary error indicating that the Printer is too busy processing jobs and/or other requests. The client  
5693 SHOULD try the unmodified request again at some later point in time with an expectation that the  
5694 temporary busy condition will have been cleared.

5695 13.1.5.9 server-error-job-canceled (0x0508)

5696 An error indicating that the job has been canceled by an operator or the system while the client was  
5697 transmitting the data to the IPP Printer. If a job-id and job-uri had been created, then they are returned in  
5698 the Print-Job, Send-Document, or Send-URI response as usual; otherwise, no job-id and job-uri are  
5699 returned in the response.

5700 13.1.5.10 server-error-multiple-document-jobs-not-supported (0x0509) Issue 34

5701 The IPP object does not support multiple documents per job and a client attempted to supply document  
5702 data with a second Send-Document or Send-URI operation.

5703 13.2 Status Codes for IPP Operations

5704 PJ = Print-Job, PU = Print-URI, CJ = Create-Job, SD = Send-Document  
 5705 SU = Send-URI, V = Validate-Job, GA = Get-Job-Attributes and  
 5706 Get-Printer-Attributes, GJ = Get-Jobs, C = Cancel-Job

5791 14. APPENDIX C: "media" keyword values

5792 Standard keyword values are taken from several sources.

5793 Standard values are defined (taken from DPA[ISO10175] and the Printer MIB[RFC1759]):

- 5794 'default': The default medium for the output device
- 5795 'iso-a4-white': Specifies the ISO A4 white medium
- 5796 'iso-a4-colored': Specifies the ISO A4 colored medium
- 5797 'iso-a4-transparent': Specifies the ISO A4 transparent medium
- 5798 'iso-a3-white': Specifies the ISO A3 white medium
- 5799 'iso-a3-colored': Specifies the ISO A3 colored medium
- 5800 'iso-a5-white': Specifies the ISO A5 white medium
- 5801 'iso-a5-colored': Specifies the ISO A5 colored medium
- 5802 'iso-b4-white': Specifies the ISO B4 white medium
- 5803 'iso-b4-colored': Specifies the ISO B4 colored medium
- 5804 'iso-b5-white': Specifies the ISO B5 white medium
- 5805 'iso-b5-colored': Specifies the ISO B5 colored medium
- 5806 'jis-b4-white': Specifies the JIS B4 white medium
- 5807 'jis-b4-colored': Specifies the JIS B4 colored medium
- 5808 'jis-b5-white': Specifies the JIS B5 white medium
- 5809 'jis-b5-colored': Specifies the JIS B5 colored medium

5810

5811 The following standard values are defined for North American media:

- 5812 'na-letter-white': Specifies the North American letter white medium
- 5813 'na-letter-colored': Specifies the North American letter colored medium
- 5814 'na-letter-transparent': Specifies the North American letter transparent medium
- 5815 'na-legal-white': Specifies the North American legal white medium
- 5816 'na-legal-colored': Specifies the North American legal colored medium

5817

5818 The following standard values are defined for envelopes:

- 5819 'iso-b4-envelope': Specifies the ISO B4 envelope medium
- 5820 'iso-b5-envelope': Specifies the ISO B5 envelope medium
- 5821 'iso-c3-envelope': Specifies the ISO C3 envelope medium
- 5822 'iso-c4-envelope': Specifies the ISO C4 envelope medium
- 5823 'iso-c5-envelope': Specifies the ISO C5 envelope medium
- 5824 'iso-c6-envelope': Specifies the ISO C6 envelope medium
- 5825 'iso-designated-long-envelope': Specifies the ISO Designated Long envelope medium
- 5826 'na-10x13-envelope': Specifies the North American 10x13 envelope medium
- 5827 'na-9x12-envelope': Specifies the North American 9x12 envelope medium

5828 'monarch-envelope': Specifies the Monarch envelope  
5829 'na-number-10-envelope': Specifies the North American number 10 business envelope medium  
5830 'na-7x9-envelope': Specifies the North American 7x9 inch envelope  
5831 'na-9x11-envelope': Specifies the North American 9x11 inch envelope  
5832 'na-10x14-envelope': Specifies the North American 10x14 inch envelope  
5833 'na-number-9-envelope': Specifies the North American number 9 business envelope  
5834 'na-6x9-envelope': Specifies the North American 6x9 inch envelope  
5835 'na-10x15-envelope': Specifies the North American 10x15 inch envelope  
5836

5837 The following standard values are defined for the less commonly used media (white-only):

5838 'executive-white': Specifies the white executive medium  
5839 'folio-white': Specifies the folio white medium  
5840 'invoice-white': Specifies the white invoice medium  
5841 'ledger-white': Specifies the white ledger medium  
5842 'quarto-white': Specifies the white quarto medium  
5843 'iso-a0-white': Specifies the ISO A0 white medium  
5844 'iso-a1-white': Specifies the ISO A1 white medium  
5845 'iso-a2-white': Specifies the ISO A2 white medium  
5846 'iso-a6-white': Specifies the ISO A6 white medium  
5847 'iso-a7-white': Specifies the ISO A7 white medium  
5848 'iso-a8-white': Specifies the ISO A8 white medium  
5849 'iso-a9-white': Specifies the ISO A9 white medium  
5850 'iso-10-white': Specifies the ISO A10 white medium  
5851 'iso-b0-white': Specifies the ISO B0 white medium  
5852 'iso-b1-white': Specifies the ISO B1 white medium  
5853 'iso-b2-white': Specifies the ISO B2 white medium  
5854 'iso-b3-white': Specifies the ISO B3 white medium  
5855 'iso-b6-white': Specifies the ISO B6 white medium  
5856 'iso-b7-white': Specifies the ISO B7 white medium  
5857 'iso-b8-white': Specifies the ISO B8 white medium  
5858 'iso-b9-white': Specifies the ISO B9 white medium  
5859 'iso-b10-white': Specifies the ISO B10 white medium  
5860 'jis-b0-white': Specifies the JIS B0 white medium  
5861 'jis-b1-white': Specifies the JIS B1 white medium  
5862 'jis-b2-white': Specifies the JIS B2 white medium  
5863 'jis-b3-white': Specifies the JIS B3 white medium  
5864 'jis-b6-white': Specifies the JIS B6 white medium  
5865 'jis-b7-white': Specifies the JIS B7 white medium  
5866 'jis-b8-white': Specifies the JIS B8 white medium  
5867 'jis-b9-white': Specifies the JIS B9 white medium  
5868 'jis-b10-white': Specifies the JIS B10 white medium  
5869

5870 The following standard values are defined for engineering media:

- 5871 'a': Specifies the engineering A size medium
- 5872 'b': Specifies the engineering B size medium
- 5873 'c': Specifies the engineering C size medium
- 5874 'd': Specifies the engineering D size medium
- 5875 'e': Specifies the engineering E size medium
- 5876

5877 The following standard values are defined for input-trays (from ISO DPA and the Printer MIB):

- 5878 'top': The top input tray in the printer.
- 5879 'middle': The middle input tray in the printer.
- 5880 'bottom': The bottom input tray in the printer.
- 5881 'envelope': The envelope input tray in the printer.
- 5882 'manual': The manual feed input tray in the printer.
- 5883 'large-capacity': The large capacity input tray in the printer.
- 5884 'main': The main input tray
- 5885 'side': The side input tray
- 5886

5887 The following standard values are defined for media sizes (from ISO DPA):

- 5888 'iso-a0': Specifies the ISO A0 size: 841 mm by 1189 mm as defined in ISO 216
- 5889 'iso-a1': Specifies the ISO A1 size: 594 mm by 841 mm as defined in ISO 216
- 5890 'iso-a2': Specifies the ISO A2 size: 420 mm by 594 mm as defined in ISO 216
- 5891 'iso-a3': Specifies the ISO A3 size: 297 mm by 420 mm as defined in ISO 216
- 5892 'iso-a4': Specifies the ISO A4 size: 210 mm by 297 mm as defined in ISO 216
- 5893 'iso-a5': Specifies the ISO A5 size: 148 mm by 210 mm as defined in ISO 216
- 5894 'iso-a6': Specifies the ISO A6 size: 105 mm by 148 mm as defined in ISO 216
- 5895 'iso-a7': Specifies the ISO A7 size: 74 mm by 105 mm as defined in ISO 216
- 5896 'iso-a8': Specifies the ISO A8 size: 52 mm by 74 mm as defined in ISO 216
- 5897 'iso-a9': Specifies the ISO A9 size: 37 mm by 52 mm as defined in ISO 216
- 5898 'iso-a10': Specifies the ISO A10 size: 26 mm by 37 mm as defined in ISO 216
- 5899 'iso-b0': Specifies the ISO B0 size: 1000 mm by 1414 mm as defined in ISO 216
- 5900 'iso-b1': Specifies the ISO B1 size: 707 mm by 1000 mm as defined in ISO 216
- 5901 'iso-b2': Specifies the ISO B2 size: 500 mm by 707 mm as defined in ISO 216
- 5902 'iso-b3': Specifies the ISO B3 size: 353 mm by 500 mm as defined in ISO 216
- 5903 'iso-b4': Specifies the ISO B4 size: 250 mm by 353 mm as defined in ISO 216
- 5904 'iso-b5': Specifies the ISO B5 size: 176 mm by 250 mm as defined in ISO 216
- 5905 'iso-b6': Specifies the ISO B6 size: 125 mm by 176 mm as defined in ISO 216
- 5906 'iso-b7': Specifies the ISO B7 size: 88 mm by 125 mm as defined in ISO 216
- 5907 'iso-b8': Specifies the ISO B8 size: 62 mm by 88 mm as defined in ISO 216
- 5908 'iso-b9': Specifies the ISO B9 size: 44 mm by 62 mm as defined in ISO 216
- 5909 'iso-b10': Specifies the ISO B10 size: 31 mm by 44 mm as defined in ISO 216
- 5910 'na-letter': Specifies the North American letter size: 8.5 inches by 11 inches
- 5911 'na-legal': Specifies the North American legal size: 8.5 inches by 14 inches
- 5912 'executive': Specifies the executive size (7.25 X 10.5 in)
- 5913 'folio': Specifies the folio size (8.5 X 13 in)

5914 'invoice': Specifies the invoice size (5.5 X 8.5 in)  
5915 'ledger': Specifies the ledger size (11 X 17 in)  
5916 'quarto': Specifies the quarto size (8.5 X 10.83 in)  
5917 'iso-c3': Specifies the ISO C3 size: 324 mm by 458 mm as defined in ISO 269  
5918 'iso-c4': Specifies the ISO C4 size: 229 mm by 324 mm as defined in ISO 269  
5919 'iso-c5': Specifies the ISO C5 size: 162 mm by 229 mm as defined in ISO 269  
5920 'iso-c6': Specifies the ISO C6 size: 114 mm by 162 mm as defined in ISO 269  
5921 'iso-designated-long': Specifies the ISO Designated Long size: 110 mm by 220 mm as defined in ISO  
5922 269  
5923 'na-10x13-envelope': Specifies the North American 10x13 size: 10 inches by 13 inches  
5924 'na-9x12-envelope': Specifies the North American 9x12 size: 9 inches by 12 inches  
5925 'na-number-10-envelope': Specifies the North American number 10 business envelope size: 4.125  
5926 inches by 9.5 inches  
5927 'na-7x9-envelope': Specifies the North American 7x9 inch envelope size  
5928 'na-9x11-envelope': Specifies the North American 9x11 inch envelope size  
5929 'na-10x14-envelope': Specifies the North American 10x14 inch envelope size  
5930 'na-number-9-envelope': Specifies the North American number 9 business envelope size  
5931 'na-6x9-envelope': Specifies the North American 6x9 envelope size  
5932 'na-10x15-envelope': Specifies the North American 10x15 envelope size  
5933 'monarch-envelope': Specifies the Monarch envelope size (3.87 x 7.5 in)  
5934 'jis-b0': Specifies the JIS B0 size: 1030mm x 1456mm  
5935 'jis-b1': Specifies the JIS B1 size: 728mm x 1030mm  
5936 'jis-b2': Specifies the JIS B2 size: 515mm x 728mm  
5937 'jis-b3': Specifies the JIS B3 size: 364mm x 515mm  
5938 'jis-b4': Specifies the JIS B4 size: 257mm x 364mm  
5939 'jis-b5': Specifies the JIS B5 size: 182mm x 257mm  
5940 'jis-b6': Specifies the JIS B6 size: 128mm x 182mm  
5941 'jis-b7': Specifies the JIS B7 size: 91mm x 128mm  
5942 'jis-b8': Specifies the JIS B8 size: 64mm x 91mm  
5943 'jis-b9': Specifies the JIS B9 size: 45mm x 64mm  
5944 'jis-b10': Specifies the JIS B10 size: 32mm x 45mm

5945 15. APPENDIX D: Processing IPP Attributes

5946 When submitting a print job to a Printer object, the IPP model allows a client to supply operation and  
5947 Job Template attributes along with the document data. These Job Template attributes in the create  
5948 request affect the rendering, production and finishing of the documents in the job. Similar types of  
5949 instructions may also be contained in the document to be printed, that is, embedded within the print data  
5950 itself. In addition, the Printer has a set of attributes that describe what rendering and finishing options  
5951 which are supported by that Printer. This model, which allows for flexibility and power, also introduces  
5952 the potential that at job submission time, these client-supplied attributes may conflict with either:

- 5953 - what the implementation is capable of realizing (i.e., what the Printer supports), as well as
- 5954 - the instructions embedded within the print data itself.

5955

5956 The following sections describe how these two types of conflicts are handled in the IPP model.

## 5957 15.1 Fidelity

5958 If there is a conflict between what the client requests and what a Printer object supports, the client may  
5959 request one of two possible conflict handling mechanisms:

- 5960 1) either reject the job since the job can not be processed exactly as specified, or
- 5961 2) allow the Printer to make any changes necessary to proceed with processing the Job the best it can.

5962

5963 In the first case the client is indicating to the Printer object: "Print the job exactly as specified with no  
5964 exceptions, and if that can't be done, don't even bother printing the job at all." In the second case, the  
5965 client is indicating to the Printer object: "It is more important to make sure the job is printed rather than  
5966 be processed exactly as specified; just make sure the job is printed even if client supplied attributes need  
5967 to be changed or ignored."

5968 The IPP model accounts for this situation by introducing an "ipp-attribute-fidelity" attribute.

5969 In a create request, "ipp-attribute-fidelity" is a boolean operation attribute that is **OPTIONALLY**  
5970 supplied by the client. The value 'true' indicates that total fidelity to client supplied Job Template  
5971 attributes and values is required. The client is requesting that the Job be printed exactly as specified, and  
5972 if that is not possible then the job **MUST** be rejected rather than processed incorrectly. The value 'false'  
5973 indicates that a reasonable attempt to print the Job is acceptable. If a Printer does not support some of  
5974 the client supplied Job Template attributes or values, the Printer **MUST** ignore them or substitute any  
5975 supported value for unsupported values, respectively. The Printer may choose to substitute the default  
5976 value associated with that attribute, or use some other supported value that is similar to the unsupported  
5977 requested value. For example, if a client supplies a "media" value of 'na-letter', the Printer may choose  
5978 to substitute 'iso-a4' rather than a default value of 'envelope'. If the client does not supply the "ipp-  
5979 attribute-fidelity" attribute, the Printer assumes a value of 'false'.

5980 Each Printer implementation **MUST** support both types of "fidelity" printing (that is whether the client  
5981 supplies a value of 'true' or 'false'):

- 5982 - If the client supplies 'false' or does not supply the attribute, the Printer object **MUST** always accept  
5983 the request by ignoring unsupported Job Template attributes and by substituting unsupported  
5984 values of supported Job Template attributes with supported values.
- 5985 - If the client supplies 'true', the Printer object **MUST** reject the request if the client supplies  
5986 unsupported Job Template attributes.

5987

5988 Since a client can always query a Printer to find out exactly what is and is not supported, "ipp-attribute-  
5989 fidelity" set to 'false' is useful when:

- 5990 1) The End-User uses a command line interface to request attributes that might not be supported.
- 5991 2) In a GUI context, if the End User expects the job might be moved to another printer and prefers a  
5992 sub-optimal result to nothing at all.
- 5993 3) The End User just wants something reasonable in lieu of nothing at all.

5994

5995 15.2 Page Description Language (PDL) Override

5996 If there is a conflict between the value of an IPP Job Template attribute and a corresponding instruction  
5997 in the document data, the value of the IPP attribute SHOULD take precedence over the document  
5998 instruction. Consider the case where a previously formatted file of document data is sent to an IPP  
5999 Printer. In this case, if the client supplies any attributes at job submission time, the client desires that  
6000 those attributes override the embedded instructions. Consider the case were a previously formatted  
6001 document has embedded in it commands to load 'iso-a4' media. However, the document is passed to an  
6002 end user that only has access to a printer with 'na-letter' media loaded. That end user most likely wants  
6003 to submit that document to an IPP Printer with the "media" Job Template attribute set to 'na-letter'. The  
6004 job submission attribute should take precedence over the embedded PDL instruction. However, until  
6005 companies that supply document data interpreters allow a way for external IPP attributes to take  
6006 precedence over embedded job production instructions, a Printer might not be able to support the  
6007 semantics that IPP attributes override the embedded instructions.

6008 The IPP model accounts for this situation by introducing a "pdl-override-supported" attribute that  
6009 describes the Printer objects capabilities to override instructions embedded in the PDL data stream. The  
6010 value of the "pdl-override-supported" attribute is configured by means outside [IPP/1.0](#).  
6011 [the scope of this IPP/1.1 document.](#)

6012 This REQUIRED Printer attribute takes on the following values:

- 6013 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values  
6014 take precedence over embedded instructions in the document data, however there is no guarantee.
- 6015 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP  
6016 attribute values take precedence over embedded instructions in the document data.

6017

6018 At job processing time, an implementation that supports the value of 'attempted' might do one of several  
6019 different actions:

- 6020 1) Generate an output device specific command sequence to realize the feature represented by the  
6021 IPP attribute value.
- 6022 2) Parse the document data itself and replace the conflicting embedded instruction with a new  
6023 embedded instruction that matches the intent of the IPP attribute value.
- 6024 3) Indicate to the Printer that external supplied attributes take precedence over embedded instructions  
6025 and then pass the external IPP attribute values to the document data interpreter.
- 6026 4) Anything else that allows for the semantics that IPP attributes override embedded document data  
6027 instructions.

6028

6029 Since 'attempted' does not offer any type of guarantee, even though a given Printer object might not do a  
6030 very "good" job of attempting to ensure that IPP attributes take a higher precedence over instructions  
6031 embedded in the document data, it would still be a conforming implementation.

6032 At job processing time, an implementation that supports the value of 'not-attempted' might do one of the  
6033 following actions:

- 6034 1) Simply pre-pend the document data with the PDL instruction that corresponds to the client-  
6035 supplied PDL attribute, such that if the document data also has the same PDL instruction, it will  
6036 override what the Printer object pre-pended. In other words, this implementation is using the  
6037 same implementation semantics for the client-supplied IPP attributes as for the Printer object  
6038 defaults.
- 6039 2) Parse the document data and replace the conflicting embedded instruction with a new embedded  
6040 instruction that approximates, but does not match, the semantic intent of the IPP attribute value.  
6041

6042 Note: The "ipp-attribute-fidelity" attribute applies to the Printer's ability to either accept or reject other  
6043 unsupported Job Template attributes. In other words, if "ipp-attribute-fidelity" is set to 'true', a Job is  
6044 accepted if and only if the client supplied Job Template attributes and values are supported by the  
6045 Printer. Whether these attributes actually affect the processing of the Job when the document data  
6046 contains embedded instructions depends on the ability of the Printer to override the instructions  
6047 embedded in the document data with the semantics of the IPP attributes. If the document data attributes  
6048 can be overridden ("pdl-override-supported" set to 'attempted'), the Printer makes an attempt to use the  
6049 IPP attributes when processing the Job. If the document data attributes can not be overridden ("pdl-  
6050 override-supported" set to 'not-attempted'), the Printer makes no attempt to override the embedded  
6051 document data instructions with the IPP attributes when processing the Job, and hence, the IPP attributes  
6052 may fail to affect the Job processing and output when the corresponding instruction is embedded in the  
6053 document data.

### 6054 15.3 Using Job Template Attributes During Document Processing.

6055 The Printer object uses some of the Job object's Job Template attributes during the processing of the  
6056 document data associated with that job. These include, but are not limited to, "orientation-requested",  
6057 "number-up", "sides", "media", and "copies". The processing of each document in a Job Object MUST  
6058 follow the steps below. These steps are intended only to identify when and how attributes are to be used  
6059 in processing document data and any alternative steps that accomplishes the same effect can be used to  
6060 implement this specification.

- 6061 1. Using the client supplied "document-format" attribute or some form of document format detection  
6062 algorithm (if the value of "document-format" is not specific enough), determine whether or not  
6063 the document data has already been formatted for printing. If the document data has been  
6064 formatted, then go to step 2. Otherwise, the document data MUST be formatted. The formatting  
6065 detection algorithm is implementation defined and is not specified by this specification. The  
6066 formatting of the document data uses the "orientation-requested" attribute to determine how the  
6067 formatted print data should be placed on a print-stream page, see section 4.2.10 for the details.  
6068
- 6069 2. The document data is in the form of a print-stream in a known media type. The "page-ranges"  
6070 attribute is used to select, as specified in section 4.2.7, a sub-sequence of the pages in the print-  
6071 stream that are to be processed and images.  
6072

6073 3. The input to this step is a sequence of print-stream pages. This step is controlled by the "number-  
6074 up" attribute. If the value of "number-up" is N, then during the processing of the print-stream  
6075 pages, each N print-stream pages are positioned, as specified in section 4.2.9, to create a single  
6076 impression. If a given document does not have N more print-stream pages, then the completion  
6077 of the impression is controlled by the "multiple-document-handling" attribute as described in  
6078 section 4.2.4; when the value of this attribute is 'single-document' or 'single-document-new-  
6079 sheet', the print-stream pages of document data from subsequent documents is used to complete  
6080 the impression.

6081  
6082 The size(scaling), position(translation) and rotation of the print-stream pages on the impression is  
6083 implementation defined. Note that during this process the print-stream pages may be rendered to  
6084 a form suitable for placing on the impression; this rendering is controlled by the values of the  
6085 "printer-resolution" and "print-quality" attributes as described in sections 4.2.12 and 4.2.13. In  
6086 the case N=1, the impression is nearly the same as the print-stream page; the differences would  
6087 only be in the size, position and rotation of the print-stream page and/or any decoration, such as a  
6088 frame to the page, that is added by the implementation.

6089  
6090 4. The collection of impressions is placed, in sequence, onto sides of the media sheets. This  
6091 placement is controlled by the "sides" attribute and the orientation of the print-stream page, as  
6092 described in section 4.2.8. The orientation of the print-stream pages affects the orientation of the  
6093 impression; for example, if "number-up" equals 2, then, typically, two portrait print-stream pages  
6094 become one landscape impression. Note that the placement of impressions onto media sheets is  
6095 also controlled by the "multiple-document-handling" attribute as described in section 4.2.4.

6096  
6097 5. The "copies" and "multiple-document-handling" attributes are used to determine how many copies  
6098 of each media instance are created and in what order. See sections 4.2.5 and 4.2.4 for the details.

6099  
6100 6. When the correct number of copies are created, the media instances are finished according to the  
6101 values of the "finishings" attribute as described in 4.2.6. Note that sometimes finishing  
6102 operations may require manual intervention to perform the finishing operations on the copies,  
6103 especially uncollated copies. This specification allows any or all of the processing steps to be  
6104 performed automatically or manually at the discretion of the Printer object.

## 6105 16. APPENDIX E: Generic Directory Schema

6106 This section defines a generic schema for an entry in a directory service. A directory service is a means  
6107 by which service users can locate service providers. In IPP environments, this means that IPP Printers  
6108 can be registered (either automatically or with the help of an administrator) as entries of type printer in  
6109 the directory using an implementation specific mechanism such as entry attributes, entry type fields,  
6110 specific branches, etc. IPP clients can search or browse for entries of type printer. Clients use the  
6111 directory service to find entries based on naming, organizational contexts, or filtered searches on  
6112 attribute values of entries. For example, a client can find all printers in the "Local Department" context.  
6113 Authentication and authorization are also often part of a directory service so that an administrator can

6114 place limits on end users so that they are only allowed to find entries to which they have certain access  
6115 rights. IPP itself does not require any specific directory service protocol or provider.

6116 Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry  
6117 object can appear as multiple directory entry object with different names for each object. In each case,  
6118 each alias refers to the same directory entry object which refers to a single IPP Printer object.

6119 The generic schema is a subset of IPP Printer Job Template and Printer Description attributes (sections  
6120 4.2 and 4.4). These attributes are identified as either RECOMMENDED or OPTIONAL for the  
6121 directory entry itself. This conformance labeling is NOT the same conformance labeling applied to the  
6122 attributes of IPP Printers objects. The conformance labeling in this Appendix is intended to apply to  
6123 directory templates and to IPP Printer implementations that subscribe by adding one or more entries to a  
6124 directory. RECOMMENDED attributes SHOULD be associated with each directory entry. OPTIONAL  
6125 attributes MAY be associated with the directory entry (if known or supported). In addition, all directory  
6126 entry attributes SHOULD reflect the current attribute values for the corresponding Printer object.

6127 The names of attributes in directory schema and entries SHOULD be the same as the IPP Printer  
6128 attribute names as shown.

6129 In order to bridge between the directory service and the IPP Printer object, one of the RECOMMENDED  
6130 directory entry attributes is the Printer object's "printer-uri-supported" attribute. The IPP client queries  
6131 the "printer-uri-supported" attribute in the directory entry and then addresses the IPP Printer object using  
6132 one of its URIs. The "uri-security-supported" attribute identifies the protocol (if any) used to secure a  
6133 channel.

6134 The following attributes define the generic schema for directory entries of type PRINTER:

6135	printer-uri-supported	RECOMMENDED	Section 4.4.1
6136	<u>uri-authentication-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.2</u>
6137	uri-security-supported	RECOMMENDED	Section 4.4.3
6138	printer-name	RECOMMENDED	Section 4.4.4
6139	printer-location	RECOMMENDED	Section 4.4.5
6140	printer-info	OPTIONAL	Section 4.4.6
6141	printer-more-info	OPTIONAL	Section 4.4.7
6142	printer-make-and-model	RECOMMENDED	Section 4.4.9
6143	charset-supported	OPTIONAL	Section 4.4.18
6144	generated-natural-language-		
6145	supported	OPTIONAL	Section 4.4.20
6146	document-format-supported	RECOMMENDED	Section 4.4.22
6147	<u>compression-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.32</u>
6148	color-supported	RECOMMENDED	Section 4.4.26
6149	finishings-supported	OPTIONAL	Section 4.2.6
6150	number-up-supported	OPTIONAL	Section 4.2.7
6151	sides-supported	RECOMMENDED	Section 4.2.8
6152	media-supported	RECOMMENDED	Section 4.2.11
6153	printer-resolution-supported	OPTIONAL	Section 4.2.12
6154	print-quality-supported	OPTIONAL	Section 4.2.13

6155	<u>ipp-versions-supported</u>	RECOMMENDED	Section 4.4.14
6156	<u>multiple-document-jobs-supported</u>	OPTIONAL	Section 4.4.16
6157	<u>pages-per-minute</u>	OPTIONAL	Section 4.4.36
6158	<u>pages-per-minute-color</u>	OPTIONAL	Section 4.4.37
6159			

6160 ~~APPENDIX F: Change History for the IPP Model and Semantics document~~

6161 ~~The following substantive changes and major clarifications have been made to this document from the~~  
 6162 ~~June 30, 1998 version based on the interoperability testing that took place September 23-25 1998 and~~  
 6163 ~~subsequent mailing list and meeting discussions. They are listed in the order of occurrence in the~~  
 6164 ~~document. These changes are the ones that might affect implementations. Clarifications that are~~  
 6165 ~~unlikely to affect implementations are not listed. The issue numbers refer to the IPP Issues List which is~~  
 6166 ~~available in the following directory:~~

6167 ~~<ftp://ftp.pwg.org/pub/pwg/ipp/approved-clarifications/>~~

Section	Description
global	Replaced TLS references with SSL3 references as agreed with our Area Director on 11/12/1998.
global	Removed the indications that some of these IPP documents are informational, since the intent is now to publish all IPP/1.0 documents as informational as agreed with our Area Director on 11/12/1998.
3.1.2, 16.3.3 {now IPP- IIG}	Clarify that the IPP object SHOULD NOT validate the range of the request-id being 1 to 2**31-1, but accepts and returns any value. Clients MUST still keep in the range 1 to 2**31 though. If the request is terminated before the complete "request id" is received, the IPP object rejects the request and returns a response with a "request-id" of 0 (Issue 1.36).
3.1.4.1, 14.1.4.14	Clarified that when a client submits a request in a charset that is not supported, the IPP object SHOULD return any 'text' or 'name' attributes in the 'utf-8' charset, if it returns any, since clients and IPP objects MUST support 'utf-8'. (Issue 1.19)
3.1.4.1	Clarified Section 3.1.4.1 Request Operation Attributes that a client MAY use the attribute level natural language override (text/nameWithLanguage) redundantly in a request. (Issue 1.46)
3.1.4.2	Clarified Section 3.1.4.2 Response Operation Attributes that an IPP object MAY use the attribute level natural language override (text/nameWithLanguage) redundantly in a response. (Issue 1.46)
3.1.6	Clarified section 3.1.6: If the Printer object supports the "status-message" operation attribute, it NEED NOT return a status message for the following error status codes: 'client-error-bad-request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-

	supported', and 'server error version not supported'.
3.2.1.1	Clarified that if a client is not supplying any Job Template attributes in a request, the client SHOULD omit Group 2 rather than sending an empty group. However, a Printer object MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.16)
3.2.1.2, 3.2.5.2, 3.2.6.2, 3.3.1.2, 3.3.3.2, 3.3.4.2,	Clarified that if an IPP object is not returning any Unsupported Attributes in a response, the IPP object SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.17)
3.2.1.2, 14.1.2.2, 14.1.4.12	Clarified that an IPP object MUST treat an unsupported attribute syntax supplied in a request in the same way as an unsupported value. The IPP object MUST return the attribute, the attribute syntax, and the value in the Unsupported Attributes group. (Issue 1.26)
3.2.5.2, 3.2.6.2, 3.3.4.2, 14.1.2.1, 14.1.2.2, 14.1.4.12	Clarified for Get Printer Attributes, Get Jobs, and Get Job Attributes that an IPP object MUST return 'successful-ok-ignored-or-substituted-attributes' (0x1), rather than 'successful-ok' (0x0), when a client supplies unsupported attributes as values of the 'requested-attributes' operation attribute. (Issue 1.24) Also clarified that the response NEED NOT contain the "requested-attributes" operation attribute with any supplied values (attribute keywords) that were requested by the client but are not supported by the IPP object. (Issue 1.18)
3.2.6.2 4.1.1.2 4.3.24	Deleted the job-level natural language override (NLO) from Section 3.2.6.2 Get Jobs Response so that all operation responses are the same with respect to NLO. (Issue 1.47)
3.3.1	Clarified that an IPP Printer that supports the Create-Job operation MUST handle the situation when a client does not supply Send Document or Send URI operations within a one-to-four-minute time period. Also clarified that a client MUST send documents in a multi-document job without undue or unbounded delay. (Issue 1.28)
3.3.3	Clarified that the IPP object MUST reject a Cancel-Job request if the job is in 'completed', 'canceled', or 'aborted' job states. (Issue 1.12)
4.1.2.3	Added this new sub-section: it specifies that nameWithoutLanguage plus the implicit natural language matches nameWithLanguage, if the values and natural languages are the same. Also added that keyword never matches nameWithLanguage or nameWithoutLanguage. Clarified that if both have countries, that the countries SHOULD match as well. If either do not, then the country field SHOULD be ignored. (Issues 1.33 and 1.34)
4.1.5	Clarified regarding the case insensitivity of URLs to refer only to the RFCs that define them. (Issue 1.10)
4.1.11	Clarified that 'boolean' is not a full-sized integer. (Issue 1.38)
4.1.15	Clarified that 'resolution' is not three full-sized integers. (Issue 1.20)
4.2.*	Clarified that standard values are keywords or enums, not names. (Issue

	<del>1.49).</del>
4.2.4	<del>Added the 'single document new sheet' value to Section 4.2.4 multiple-document handling. (Issue 1.54)</del>
4.4.18, 4.4.19	<del>Clarified that the "document format default" and "document format supported" Printer Description attributes are REQUIRED to agree with the table. (Issue 1.4)</del>
4.4.21	<del>Changed "queued job count" from OPTIONAL to RECOMMENDED. (Issue 1.14)</del>
4.4.28	<del>Clarified that the implementation supplied value for the "multiple operation time out" attribute SHOULD be between 30 and 240 seconds, though the implementation MAY allow the administrator to set values, and MAY allow values outside this range. (Issue 1.28)</del>
5.1, 5.2.5	<del>Clarified Client Conformance that if a client supports an attribute of 'text' attribute syntax, that it MUST support both the textWithoutLanguage and the textWithLanguage forms. Same for 'name' attribute syntax. Same for an IPP object (Issue 1.48)</del>
6.5, 12.8	<del>Added new section to allow Attribute Groups to be registered as extensions for being passed in operation requests and responses. (Issue 1.25)</del>
7:	<del>Updated the table of text and name attributes to agree with Section 4.2.</del>
8.5	<del>Added a new section RECOMMENDING that the Get Jobs SHOULD return non-IPP jobs whether or not assigning them a job-id and job-uri. Also RECOMMENDED generating, if possible, job-id and job-uri and supporting other IPP operations on foreign jobs as an implementer option. (Issue 1.32)</del>
9:	<del>Updated document references.</del>
14.1.4.14	<del>Clarified 'client error charset not supported' that 'utf 8' must be used for any 'text' or 'name' attributes returned in the error response (Issue 1.19).</del>
14.1.5.9	<del>Added a new error code 'server error job canceled' (0x0508) to be returned if a job is canceled by another client or aborted by the IPP object while the first client is still sending the document data. (Issue 1.29)</del>
16.3, 16.4	<del>Moved these sections recommending operation processing steps to the new Implementer's Guide (informational). There indicated that all of the error checks are not required, so an IPP object MAY be forgiving and accept non-conforming requests. However, a conforming client MUST supply requests that would pass all of the error checks indicated. (Issue 1.21)</del>
17	<del>Changed directory schema attributes from REQUIRED to RECOMMENDED. Changed some of the OPTIONAL to RECOMMENDED to agree with the SLP template. Changed the "charset supported" and "natural language supported" from REQUIRED to OPTIONAL. Recommended that the names be the same in a directory entry as the IPP attribute names. (Issue 1.53)</del>

6171

6172 17. APPENDIX F: Differences between the IPP/1.0 and IPP/1.1 "Model and Semantics" Specifications

6173 This Appendix is divided into two lists that summarize the differences between IPP/1.1 (this document)  
6174 and IPP/1.0 [RFC2566]. The section numbers refer to the numbers in this document which in some  
6175 cases have changed from RFC 2566. When a change affects multiple sections, the item is listed once in  
6176 the order of the first section affected and the remaining affected section numbers are indicated.

6177 The first list contains extensions and clarifications and the second list contains changes in semantics or  
6178 conformance. However, note that client and IPP object implementations of IPP/1.0 MAY implement  
6179 any of the extensions and clarifications in this document.

6180 The following extensions and clarifications have been incorporated into this document:

- 6181 1. Section 2.1 - clarified that the term "client" can be either contained in software controlled by an  
6182 end user or a part of a print server that controls devices. Issue 4 and Issue 5
- 6183 2. Section 2.4 - added the description of the new "uri-authentication-supported" Printer Description  
6184 attribute. Issue 2
- 6185 3. Section 3.1.3, 3.1.6, 3.2.5.2, and - clarified the error handling for operation attributes that have  
6186 their own status code. Issues 18, 23, and 27
- 6187 4. Sections 3.1.7 - Added this new section to clarify returning Unsupported Attributes for all  
6188 operations, including only returning attributes that were in the request. Issues 18, 23, and 27
- 6189 5. Sections 3.1.7 and 4.1 - clarified the encoding of the "out-of-band" 'unsupported' and 'unknown'  
6190 values. Issues 12 and 15
- 6191 6. Section 3.1.8 - clarified that only the version number parameter will be carried forward into  
6192 future major or minor versions of the protocol.
- 6193 7. Section 3.1.8 - indicated that IPP/1.1 Printers SHOULD support version '1.0' and that not all  
6194 previous minor versions need be supported. Issue 33
- 6195 8. Section 3.1.8 - relaxed the requirements to increment the major version number. Issue 33
- 6196 9. Section 3.1.9, and 3.2.5 - added the 'processing' state to the list of job states that a job can be in  
6197 after a Create-Job operation. Issue 13
- 6198 10. Section 3.1.9 - clarified that a non-spooling Printer MAY accept zero or more subsequent jobs  
6199 while processing a job and flow control them down. Subsequent create requests are rejected with  
6200 the 'server-error-busy' error status. Issue 20
- 6201 11. Section 3.2.1.1 - clarified the validation of the "compression" operation attribute and its  
6202 relationship to the validation of the "document-format" attribute and returning Unsupported  
6203 Attributes. Issues 6, 11, and 28
- 6204 12. Sections 3.2.1.1, 4.3.8, 13.1.4.16, and 13.1.4.17 - added the 'client-error-compression-not-  
6205 supported', 'client-error-compression-error' status codes and the 'unsupported-compression' and  
6206 'compression-error' job-state-reasons. Issue 28
- 6207 13. Sections 3.2.1.1 and 4.3.8 - added 'unsupported-document-format' and 'document-format-error'  
6208 job-state-reasons. Issue 3
- 6209 14. Sections 3.2.2, 4.3.8 and 13.1.4.19 - added 'client-error-document-access-error' status code and  
6210 'document-access-error' job state reason. Issue 35

- 6211 15. Section 3.2.6 - clarified that "limit" takes precedence over "which-jobs" and "my-jobs". Issue 8  
6212 16. Section 3.2.6.2 - clarified that Get-Jobs returns 'successful-ok' when no jobs to return. Issue 24  
6213 17. Sections 3.2.7, 3.2.8, and 3.2.9 - added the OPTIONAL Pause-Printer, Resume-Printer, and  
6214 Purge-Jobs operations  
6215 18. Sections 3.3.5, 3.3.6, and 3.3.7 - added the OPTIONAL Hold-Job, Release-Job, and Restart-Job  
6216 operations.  
6217 19. Section 4.1.9.1 - clarified that 'application/octet-stream' auto-sensing can happen at create request  
6218 time and/or job/document processing time. Issue 9 and Issue 10  
6219 20. Section 4.2 - clarified that xxx-supported have multiple keywords and/or names by adding  
6220 parentheses to the table to give: (1setOf (type3 keyword | name))  
6221 21. Section 4.2.2 - added the 'indefinite' keyword value to the "job-hold-until" attribute for use with  
6222 the create operations and Hold-Job and Restart-Job operations.  
6223 22. Section 4.2.4 - clarified that "multiple-document-handling" MUST be supported if the Printer  
6224 supports multiple documents per job Issue 34  
6225 23. Section 4.2.6 - added more enum values to the "finishings" Job Template attribute.  
6226 24. Section 4.3.7 - added that a forwarding server that cannot get any job state MAY return the job's  
6227 state as 'completed', provided that it also return the new 'queued-in-device' job state reason. Issue  
6228 14  
6229 25. Section 4.3.7.1 - added the Partitioning of Job States section.  
6230 26. Section 4.3.8 - added 'job-data-insufficient' job state reason to indicate whether sufficient data  
6231 has arrived for the document to start to be processed. Issue 13  
6232 27. Section 4.3.8 - added 'document-access-error' job state reason to indicate an access error of any  
6233 kind. Issue 35  
6234 28. Section 4.3.8 - added 'job-queued-for-marker' job state reason to indicate whether the job has  
6235 completed some processing and is waiting for the marker. Issue 31  
6236 29. Section 4.3.8 - added 'unsupported-compression' and 'compression-error' job state reasons to  
6237 indicate compression not supported or compression processing error after the create has been  
6238 accepted. Issue 6  
6239 30. Section 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job state  
6240 reasons to indicate document not supported or document format processing error after the create  
6241 has been accepted. Issue 3  
6242 31. Section 4.3.8 - added 'queued-in-device' job state reason to indicate that a job as been forwarded  
6243 to a print system or device that does not provide any job status. Issue 14

- 6244 32. Section 4.4.3 - clarified "uri-security-supported" is orthogonal to Client Authentication so that  
6245 'none' does not exclude Client Authentication. Issue 2
- 6246 33. Section 4.4.12 - added the 'moving-to-paused' keyword value to the "printer-state-reasons"  
6247 attribute for use with the Pause-Job operation.
- 6248 34. Section 4.4.12 - replaced the duplicate 'marker-supply-low' keyword with the missing 'toner-  
6249 empty' keyword for the "printer-state-reasons" attribute.
- 6250 35. Section 4.4.15 - added the enum values to the "operations-supported" attribute for the new  
6251 operations. Clarified that the values of this attribute are encoded as any enum, namely 32-bit  
6252 values.
- 6253 36. Sections 4.4.36 and 4.4.37 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-  
6254 color" Printer Description attributes.
- 6255 37. Section 4.4.30 - clarified that the dateTime value of "printer-current-time" is on a "best efforts  
6256 basis". If a proper date-time cannot be obtained, the implementation returns the 'no-value' out-of-  
6257 band value. Also clarified that the time zone NEED NOT be the time zone that the people near  
6258 the device use and that the client SHOULD display the dateTime attributes in the user's local  
6259 time. Issue 17
- 6260 38. Section 5.1 - clarified that any response MAY contain additional attribute groups, attributes, or  
6261 attribute values. Issues 25 and 26
- 6262 39. Section 5.1 - clarified that a client SHOULD do its best to prevent a channel from being closed  
6263 by a lower layer when the channel is flow controlled off by the IPP Printer. Issues 4 and 5
- 6264 40. Section 8.3 - clarified the use of URIs for each Client Authentication mechanism.
- 6265 41. Section 8.5 - added the security discussion around the new operator operations.
- 6266 42. Section 13.1.4.16 - added client-error-compression-not-supported (0x040F) Issue 6
- 6267 43. Section 13.1.4.17 - added client-error-compression-error (0x0410) Issue 6
- 6268 44. Section 13.1.4.18 - added client-error-document-format-error (0x0411) Issue 28
- 6269 45. Section 13.1.4.19 - added client-error-document-access-error (0x0412) Issue 35
- 6270 46. Section 13.1.5.10 - added server-error-multiple-document-jobs-not-supported (0x0509) Issue 34
- 6271 47. Section 16 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-color" Printer  
6272 attributes to the Directory schema.
- 6273 48. Section 16 - added OPTIONAL "multiple-document-jobs-supported" to the Directory schema.  
6274 Issue 34
- 6275 49. Section 16 - added RECOMMENDED "uri-security-supported", "compression-supported", and  
6276 "ipp-versions-supported" to the Directory schema. Issues 2,

6277 The following changes in semantics and/or conformance have been incorporated into this document:

- 6278 1. Section 3.1.8, 5.2.4, and 13.1.5.4 - Clients and IPP objects MUST support version 1.1 and  
6279 SHOULD support version 1.0. Issue 33 and Issue 36
- 6280 2. Section 3.2.1.1 and section 4.4.32 - changed the "compression" and "compression-supported"  
6281 attributes from OPTIONAL to REQUIRED. Issue 28
- 6282 3. Sections 3.2.1.2 and 4.3.8 - changed "job-state-reasons" from RECOMMENDED to  
6283 REQUIRED, so that "job-state-reasons" MUST be returned in create operation responses. Issue  
6284 30
- 6285 4. Sections 3.2.4, 3.3.1, 4.4.16, and 16 - changed Create-Job/Send-Document so that they MAY be  
6286 implemented while only supporting one document jobs. Added the "multiple-document-jobs-

- 6287 supported" boolean Printer Description attribute to indicate whether Create-Job/Send-Document  
6288 support multiple document jobs or not. Added to the Directory schema. **Issue 34**  
6289 5. Section 4.1.9 - deleted 'text/plain; charset=iso-10646-ucs-2', since binary is not legal with the  
6290 'text' type.  
6291 6. Section 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED. **Issue 30**  
6292 7. Section 4.3.12 - added OPTIONAL 'dateTime' attribute syntax to "time-at-creation", "time-at-  
6293 processing", and "time-at-completed" Job Description attributes for use in version '1.1' responses.  
6294 **Issue 17**  
6295 8. Section 4.3.12 - changed the "time-at-creation", "time-at-processing", and "time-at-completed"  
6296 Event Time Job Description attributes from OPTIONAL to REQUIRED. **Issue 17**  
6297 9. Section 4.3.12.4 - added the REQUIRED "job-printer-up-time (integer(1:MAX))" Job  
6298 Description attribute as an alias for "printer-up-time" to reduce number of operations to get job  
6299 times. **Issue 17**  
6300 10. Section 4.4.2 - added the REQUIRED "uri-authentication-supported (1setOf type2 keyword)"  
6301 Printer Description attribute to describe the Client Authentication used by each Printer URI.  
6302 **Issue 2**  
6303 11. Section 4.4.11 - clarified the "printer-state" to allow a Printer that can interpret one or more jobs  
6304 (rip) while marking one job to have those jobs all in the 'processing' state. **Issue 31**  
6305 12. Section 4.4.12 - changed "printer-state-reasons" Printer Description attribute from OPTIONAL to  
6306 REQUIRED. **Issue 30**  
6307 13. Section 4.4.14 - added the REQUIRED "ipp-versions-supported (1setOf keyword)" Printer  
6308 Description attribute, since IPP/1.1 Printers do not have to support version '1.0'.  
6309 14. Section 4.4.16 - added the REQUIRED "multiple-document-jobs-supported (boolean)" Printer  
6310 Description attribute so that a client can tell whether a Printer that supports Create-Job/Send-  
6311 Document supports multiple document jobs or not. **Issue 34**  
6312 15. Section 4.4.24 - changed the "queued-job-count" Printer Description attribute from  
6313 RECOMMENDED to REQUIRED. **Issue 29**  
6314 16. Section 4.4.32 - changed "compression-supported (1setOf type3 keyword)" Printer Description  
6315 attribute from OPTIONAL to REQUIRED. **Issue 28**  
6316 17. Section 5.1 - changed the client security requirements from RECOMMENDED non-standards  
6317 track SSL3 to MUST/SHOULD [which is to be determined in consultation with the Area  
6318 Director] support Client Authentication as defined in the IPP/1.1 Encoding and Transport  
6319 document [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication  
6320 as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO].  
6321 18. Section 5.2.7 - changed the IPP object security requirements from OPTIONAL non-standards  
6322 track SSL3 to MUST/SHOULD [which is to be determined in consultation with the Area  
6323 Director] contain support for Client Authentication as defined in the IPP/1.1 Encoding and  
6324 Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to  
6325 configure the Printer so that all, some, or none of the users are authenticated. An IPP Printer  
6326 implementation SHOULD contain support for Operation Privacy and Server Authentication as  
6327 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation  
6328 MAY allow an administrator to configure the degree of support for Operation Privacy and Server  
6329 Authentication.

6330 See also the "IPP/1.1 Encoding and Transport" [IPP-PRO] document for differences between IPP/1.0  
6331 [RFC2565] and IPP/1.1 [IPP-PRO].
