17 Status of this Memo

18 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of  
19 [RFC2026]. Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its  
20 areas, and its working groups. Note that other groups may also distribute working documents as Internet-  
21 Drafts.

22 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or  
23 obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or  
24 to cite them other than as "work in progress".

25 ~~To learn the current status of any Internet Draft, please check the "Iid-abstracts.txt" listing contained in~~  
26 ~~the~~ The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

27 The list of Internet-Draft Shadow Directories ~~on <ftp.is.co.za> (Africa), <nic.nordu.net> (Europe), <munnari.oz.au>~~  
28 ~~(Pacific Rim), <ftp.ietf.org> (US East Coast), or <ftp.isi.edu> (US West Coast).~~ can be accessed as  
29 <http://www.ietf.org/shadow.html>.

30 Abstract

31 This document is one of a set of documents, which together describe all aspects of a new Internet Printing  
32 Protocol (IPP). IPP is an application level protocol that can be used for distributed printing using Internet  
33 tools and technologies. This document describes a simplified model consisting of abstract objects, their  
34 attributes, and their operations that is independent of encoding and transport. The model consists of a  
35 Printer and a Job object. A Job optionally supports multiple documents. IPP ~~4.0~~1.1 semantics allow end-  
36 users and operators to query printer capabilities, submit print jobs, inquire about the status of print jobs and  
37 printers, cancel, hold, release, and ~~and cancel~~restart print jobs. IPP 1.1 semantics allow operators to pause,  
38 resume, and purge (jobs from) Printer objects. This document also addresses security, internationalization,  
39 and directory issues.

40 The full set of IPP documents includes:

41 Design Goals for an Internet Printing Protocol [~~IPP-REQ~~][RFC2567]  
42 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~IPP-~~  
43 ~~RAT~~][RFC2568]  
44 Internet Printing ~~Protocol/1.0:Protocol/1.1~~: Model and Semantics (this document)  
45 Internet Printing ~~Protocol/1.0:Protocol/1.1~~: Encoding and Transport [IPP-PRO]  
46 Internet Printing ~~Protocol/1.0:Protocol/1.1~~: Implementer's Guide [IPP-IIG]  
47 Mapping between LPD and IPP Protocols [~~IPP-LPD~~][RFC2569]  
48

49 The "Design Goals for an Internet Printing Protocol" document takes a broad look at distributed printing  
50 functionality, and it enumerates real-life scenarios that help to clarify the features that need to be included  
51 in a printing protocol for the Internet. It identifies requirements for three types of users: end users,  
52 operators, and administrators. It calls out a subset of end user requirements that are satisfied in IPP/1.0.  
53 ~~Operator and administrator requirements are out of scope for version 1.0.~~ A few OPTIONAL operator  
54 operations have been added to IPP/1.1.

55 The "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol" document  
56 describes IPP from a high level view, defines a roadmap for the various documents that form the suite of  
57 IPP specification documents, and gives background and rationale for the IETF working group's major  
58 decisions.

59 The "Internet Printing ~~Protocol/1.0:Protocol/1.1~~: Encoding and Transport" document is a formal mapping  
60 of the abstract operations and attributes defined in the model document onto HTTP/1.1. It defines the  
61 encoding rules for a new Internet MIME media type called "application/ipp". This document also defines  
62 the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This  
63 document defines a new scheme named 'ipp' for identifying IPP printers and jobs. Finally, this document  
64 defines interoperability rules for supporting IPP/1.0 clients. Issue 33

65 The "Internet Printing ~~Protocol/1.0:Protocol/1.1~~: Implementer's Guide" document gives insight and advice  
66 to implementers of IPP clients and IPP objects. It is intended to help them understand ~~IPP/1.0~~IPP/1.1 and  
67 some of the considerations that may assist them in the design of their client and/or IPP object  
68 implementations. For example, a typical order of processing requests is given, including error checking.  
69 Motivation for some of the specification decisions is also included.

70 The "Mapping between LPD and IPP Protocols" document gives some advice to implementers of gateways  
71 between IPP and LPD (Line Printer Daemon) implementations.

## Table of Contents

72		
73	1. Introduction.....	10
74	1.1 Simplified Printing Model .....	11
75	2. IPP Objects.....	13
76	2.1 Printer Object .....	13
77	2.2 Job Object .....	15
78	2.3 Object Relationships .....	16
79	2.4 Object Identity.....	17
80	3. IPP Operations .....	19
81	3.1 Common Semantics .....	20
82	3.1.1 Required Parameters .....	20
83	3.1.2 Operation IDs and Request IDs .....	21
84	3.1.3 Attributes .....	21
85	3.1.4 Character Set and Natural Language Operation Attributes.....	22
86	3.1.4.1 Request Operation Attributes.....	23
87	3.1.4.2 Response Operation Attributes .....	26
88	3.1.5 Operation Targets.....	26
89	3.1.6 Operation <b>Response</b> Status Codes and Status Messages .....	28
90	3.1.6.1 "status-code" (type2 enum).....	28
91	3.1.6.2 "status-message" (text(255)) .....	28
92	3.1.6.3 "detailed-status-message" (text(MAX)) <b>Issue 35</b> .....	29
93	3.1.6.4 "document-access-error" (text(MAX)) <b>Issue 35</b> .....	29
94	3.1.7 Unsupported Attributes.....	30
95	3.1.8 Versions .....	31
96	3.1.9 Job Creation Operations.....	32
97	3.2 Printer Operations .....	35
98	3.2.1 Print-Job Operation.....	35
99	3.2.1.1 Print-Job Request.....	35
100	3.2.1.2 Print-Job Response.....	39
101	3.2.2 Print-URI Operation.....	41
102	3.2.3 Validate-Job Operation .....	42
103	3.2.4 Create-Job Operation .....	42
104	3.2.5 Get-Printer-Attributes Operation .....	43
105	3.2.5.1 Get-Printer-Attributes Request .....	44
106	3.2.5.2 Get-Printer-Attributes Response .....	45
107	3.2.6 Get-Jobs Operation .....	46
108	3.2.6.1 Get-Jobs Request.....	46
109	3.2.6.2 Get-Jobs Response .....	48
110	3.2.7 Pause-Printer Operation.....	49
111	3.2.7.1 Pause-Printer Request .....	50
112	3.2.7.2 Pause-Printer Response.....	50
113	3.2.8 Resume-Printer Operation .....	51

114	3.2.9	Purge-Jobs Operation.....	51
115	3.3	Job Operations.....	52
116	3.3.1	Send-Document Operation.....	52
117	3.3.1.1	Send-Document Request.....	53
118	3.3.1.2	Send-Document Response .....	55
119	3.3.2	Send-URI Operation .....	55
120	3.3.3	Cancel-Job Operation .....	56
121	3.3.3.1	Cancel-Job Request.....	57
122	3.3.3.2	Cancel-Job Response .....	57
123	3.3.4	Get-Job-Attributes Operation .....	58
124	3.3.4.1	Get-Job-Attributes Request.....	58
125	3.3.4.2	Get-Job-Attributes Response .....	59
126	<u>3.3.5</u>	<u>Hold-Job Operation.....</u>	<u>60</u>
127	<u>3.3.5.1</u>	<u>Hold-Job Request.....</u>	<u>61</u>
128	<u>3.3.5.2</u>	<u>Hold-Job Response .....</u>	<u>61</u>
129	<u>3.3.6</u>	<u>Release-Job Operation .....</u>	<u>62</u>
130	<u>3.3.7</u>	<u>Restart-Job Operation .....</u>	<u>62</u>
131	<u>3.3.7.1</u>	<u>Restart-Job Request.....</u>	<u>63</u>

## 351 1. Introduction

352 The Internet Printing Protocol (IPP) is an application level protocol that can be used for distributed printing  
353 using Internet tools and technologies. IPP version ~~1.0 (IPP/1.0)~~ 1.1 (IPP/1.1) focuses only on end user  
354 functionality. This document is just one of a suite of documents that fully define IPP. The full set of IPP  
355 documents includes:

- 356 Design Goals for an Internet Printing Protocol ~~[IPP-REQ]~~[RFC2567]
- 357 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol ~~[IPP-~~  
358 ~~RAT]~~[RFC2568]
- 359 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Model and Semantics (this document)
- 360 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Encoding and Transport [IPP-PRO]
- 361 Internet Printing ~~Protocol/1.0:Protocol/1.1:~~ Implementer's Guide [IPP-IIG]
- 362 Mapping between LPD and IPP Protocols ~~[IPP-LPD]~~[RFC2569]

363  
364 Anyone reading these documents for the first time is strongly encouraged to read the IPP documents in the  
365 above order.

366 This document is laid out as follows:

- 367 - The rest of Section 1 is an introduction to the IPP simplified model for distributed printing.
- 368 - Section 2 introduces the object types covered in the model with their basic behaviors, attributes, and  
369 interactions.
- 370 - Section 3 defines the operations included in ~~IPP/1.0:IPP/1.1.~~ IPP operations are synchronous,  
371 therefore, for each operation, there is a both request and a response.
- 372 - Section 4 defines the attributes (and their syntaxes) that are used in the model.
- 373 - Sections 5 - 6 summarizes the implementation conformance requirements for objects that support the  
374 protocol and IANA considerations, respectively.
- 375 - Sections 7 - 11 cover the Internationalization and Security considerations as well as References,  
376 ~~Copyright Notice,~~ Author contact information, and Formats for Registration Proposals.
- 377 - Sections 123 - 145 are appendices that cover Terminology, Status Codes and Messages, and "media"  
378 keyword values.

379 Note: This document uses terms such as "attributes", "keywords", and "support". These  
380 terms have special meaning and are defined in the model terminology section 12.2.  
381 Capitalized terms, such as MUST, MUST NOT, REQUIRED, SHOULD, SHOULD NOT,  
382 MAY, NEED NOT, and OPTIONAL, have special meaning relating to conformance. These  
383 terms are defined in section 12.1 on conformance terminology, most of which is taken from  
384 RFC 2119 [RFC2119].

- 385 - Section 156 is an appendix that helps to clarify the effects of interactions between related attributes  
386 and their values.
- 387 - Section 167 is an appendix that enumerates the subset of Printer attributes that form a generic  
388 directory schema. These attributes are useful when registering a Printer so that a client can find the  
389 Printer not just by name, but by filtered searches as well.

390 - Section 178 is an appendix that provides a Change History summarizing the clarification and changes  
391 that might affect an implementation since the June 30, 1998 draft. additions and changes from the  
392 IPP/1.0 "Model and Semantics" document [RFC2566] to make this IPP/1.1 document.  
393 - Section 18 is the full copyright notice.

## 394 1.1 Simplified Printing Model

395 In order to achieve its goal of realizing a workable printing protocol for the Internet, the Internet Printing  
396 Protocol (IPP) is based on a simplified printing model that abstracts the many components of real world  
397 printing solutions. The Internet is a distributed computing environment where requesters of print services  
398 (clients, applications, printer drivers, etc.) cooperate and interact with print service providers. This model  
399 and semantics document describes a simple, abstract model for IPP even though the underlying  
400 configurations may be complex "n-tier" client/server systems. An important simplifying step in the IPP  
401 model is to expose only the key objects and interfaces required for printing. The model described in this  
402 model document does not include features, interfaces, and relationships that are beyond the scope of the  
403 first version of IPP (~~IPP/1.0~~). ~~IPP/1.0~~(IPP/1.1). IPP/1.1 incorporates many of the relevant ideas and  
404 lessons learned from other specification and development efforts [HTPP] [ISO10175] [LDPA] [P1387.4]  
405 [PSIS] [RFC1179] [SWP]. IPP is heavily influenced by the printing model introduced in the Document  
406 Printing Application (DPA) [ISO10175] standard. Although DPA specifies both end user and  
407 administrative features, IPP version ~~1.0 (IPP/1.0)~~ focuses only on end user functionality.

408 1.1 (IPP/1.1) focuses primarily on end user functionality with a few additional OPTIONAL operator  
409 operations.

410 The ~~IPP/1.0~~IPP/1.1 model encapsulates the important components of distributed printing into two object  
411 types:

- 412 - Printer (Section 2.1)
- 413 - Job (Section 2.2)

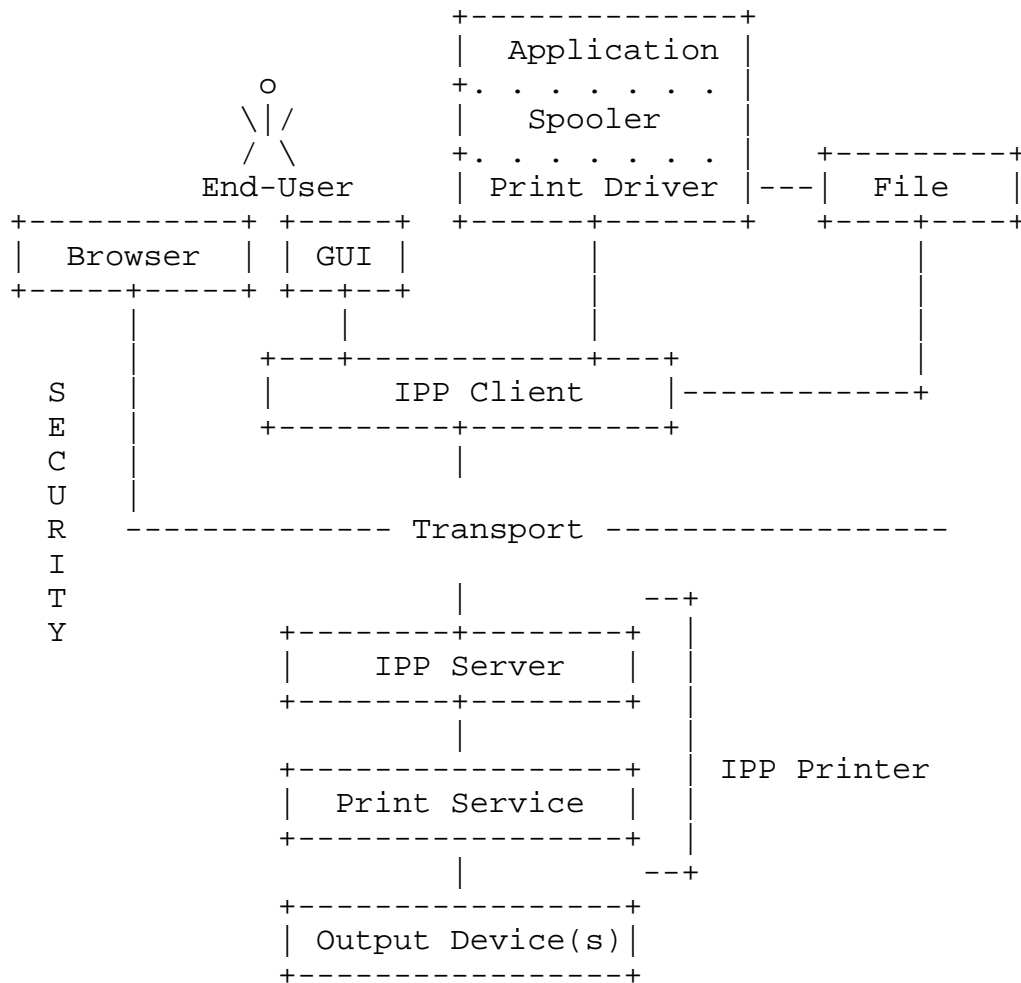

414

415 Each object type has an associated set of operations (see section 3) and attributes (see section 4).

416 It is important, however, to understand that in real system implementations (which lie underneath the  
417 abstracted ~~IPP/1.0~~IPP/1.1 model), there are other components of a print service which are not explicitly  
418 defined in the ~~IPP/1.0~~IPP/1.1 model. The following figure illustrates where ~~IPP/1.0~~IPP/1.1 fits with respect  
419 to these other components.

451 An IPP Printer object encapsulates the functions normally associated with physical output devices along  
452 with the spooling, scheduling and multiple device management functions often associated with a print  
453 server. Printer objects are optionally registered as entries in a directory where end users find and select them  
454 based on some sort of filtered and context based searching mechanism (see section 16). The directory is  
455 used to store relatively static information about the Printer, allowing end users to search for and find  
456 Printers that match their search criteria, for example: name, context, printer capabilities, etc. The more  
457 dynamic information, such as state, currently loaded and ready media, number of jobs at the Printer, errors,  
458 warnings, and so forth, is directly associated with the Printer object itself rather than with the entry in the  
459 directory which only represents the Printer object.

460 IPP clients implement the IPP protocol on the client side and give end users (or programs running on behalf  
461 of end users) the ability to query Printer objects and submit and manage print jobs. An IPP server is just  
462 that part of the Printer object that implements the server-side protocol. The rest of the Printer object  
463 implements (or gateways into) the application semantics of the print service itself. The Printer objects may  
464 be embedded in an output device or may be implemented on a host on the network that communicates with  
465 an output device.

466 When a job is submitted to the Printer object and the Printer object validates the attributes in the  
467 submission request, the Printer object creates a new Job object. The end user then interacts with this new  
468 Job object to query its status and monitor the progress of the job. ~~End users may also cancel the print~~  
469 ~~job~~An end user can also cancel their print jobs by using the Job object's Cancel-Job operation. An end-user  
470 can also hold, release, and restart their print jobs using the Job object's OPTIONAL Hold-Job, Release-Job,  
471 and Restart-Job operations, if implemented.

472 A privileged operator or administrator of a Printer object can cancel, hold, release, and restart any user's job  
473 using the REQUIRED Cancel-Job and the OPTIONAL Hold-Job, Release-Job, and Restart-Job operations.  
474 In additional privileged operator or administrator of a Printer object can pause, resume, or purge (jobs from)  
475 a Printer object using the OPTIONAL Pause-Printer, Resume-Printer, and Purge-Jobs operations, if  
476 implemented.

477 The notification service is out of scope for ~~IPP/1.0~~this IPP/1.1 document, but using such a notification  
478 service, the end user is able to register for and receive Printer specific and Job specific events. An end user  
479 can query the status of Printer objects and can follow the progress of Job objects by polling using the Get-  
480 ~~Printer-Attributes~~Printer-Attributes, Get-Jobs, and Get-Job-Attributes operations.

## 481 2. IPP Objects

482 The ~~IPP/1.0~~IPP/1.1 model introduces objects of type Printer and Job. Each type of object models relevant  
483 aspects of a real-world entity such as a real printer or real print job. Each object type is defined as a set of  
484 possible attributes that may be supported by instances of that object type. For each object (instance), the  
485 actual set of supported attributes and values describe a specific implementation. The object's attributes and  
486 values describe its state, capabilities, realizable features, job processing functions, and default behaviors  
487 and characteristics. For example, the Printer object type is defined as a set of attributes that each Printer  
488 object potentially supports. In the same manner, the Job object type is defined as a set of attributes that are  
489 potentially supported by each Job object.

490 Each attribute included in the set of attributes defining an object type is labeled as:

- 491 - "REQUIRED": each object MUST support the attribute.
- 492 - "RECOMMENDED": each object SHOULD support the attribute.
- 493 - "OPTIONAL": each object MAY support the attribute.

494  
495 ~~There is no such similar labeling of attribute values~~Some definitions of attribute values indicate that an  
496 object MUST or SHOULD support the value; otherwise, support of the value is OPTIONAL. However, if  
497 an implementation supports an attribute, it MUST support at least one of the possible values for that  
498 attribute.

### 499 2.1 Printer Object

500 The major component of the ~~IPP/1.0~~IPP/1.1 model is the Printer object. A Printer object implements the  
501 server-side of the ~~IPP/1.0~~IPP/1.1 protocol. Using the protocol, end users may query the attributes of the

502 Printer object and submit print jobs to the Printer object. The actual implementation components behind  
503 the Printer abstraction may take on different forms and different configurations. However, the model  
504 abstraction allows the details of the configuration of real components to remain opaque to the end user.  
505 Section 3 describes each of the Printer operations in detail.

506 The capabilities and state of a Printer object are described by its attributes. Printer attributes are divided  
507 into two groups:

- 508 - "job-template" attributes: These attributes describe supported job processing capabilities and defaults  
509 for the Printer object. (See section 4.2)
- 510 - "printer-description" attributes: These attributes describe the Printer object's identification, state,  
511 location, references to other sources of information about the Printer object, etc. (see section 4.4)

512  
513 Since a Printer object is an abstraction of a generic document output device and print service provider, a  
514 Printer object could be used to represent any real or virtual device with semantics consistent with the  
515 Printer object, such as a fax device, an imager, or even a CD writer.

516 Some examples of configurations supporting a Printer object include:

- 517 1) An output device with no spooling capabilities
- 518 2) An output device with a built-in spooler
- 519 3) A print server supporting IPP with one or more associated output devices
  - 520 3a) The associated output devices may or may not be capable of spooling jobs
  - 521 3b) The associated output devices may or may not support IPP

522  
523 The following figures show some examples of how Printer objects can be realized on top of various  
524 distributed printing configurations. The embedded case below represents configurations 1 and 2. The  
525 hosted and fan-out figures below represent configurations 3a and 3b.

526 In this document the term "client" refers to a software entity that sends IPP operation requests to an IPP  
527 Printer object and accepts IPP operation responses. A client MAY be:

- 528 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
529 application or
- 530 2. the print server component that sends IPP requests to either an output device or another  
531 "downstream" print server.

532 The term "IPP Printer" is a network entity that accepts IPP operation requests and returns IPP operation  
533 responses. As such, an IPP object MAY be:

- 534 1. an (embedded) device component that accepts IPP requests and controls the device or
- 535 2. a component of a print server that accepts IPP requests (where the print server controls one or more  
536 networked devices using IPP or other protocols). Issue 4

537

## 581 2.2 Job Object

582 A Job object is used to model a print job. A Job object contains documents. The information required to  
583 create a Job object is sent in a create request from the end user via an IPP Client to the Printer object. The

584 Printer object validates the create request, and if the Printer object accepts the request, the Printer object  
585 creates the new Job object. Section 3 describes each of the Job operations in detail.

586 The characteristics and state of a Job object are described by its attributes. Job attributes are grouped into  
587 two groups as follows:

- 588 - "job-template" attributes: These attributes can be supplied by the client or end user and include job  
589 processing instructions which are intended to override any Printer object defaults and/or instructions  
590 embedded within the document data. (See section 4.2)
- 591 - "job-description" attributes: These attributes describe the Job object's identification, state, size, etc.  
592 The client supplies some of these attributes, and the Printer object generates others. (See section 4.3)

593

594 An implementation **MUST** support at least one document per Job object. An implementation **MAY** support  
595 multiple documents per Job object. A document is either:

- 596 - a stream of document data in a format supported by the Printer object (typically a Page Description  
597 Language - PDL), or
- 598 - a reference to such a stream of document data

599

600 In [IPP/1.0](#), [IPP/1.1](#), a document is not modeled as an IPP object, therefore it has no object identifier or  
601 associated attributes. All job processing instructions are modeled as Job object attributes. These attributes  
602 are called Job Template attributes and they apply equally to all documents within a Job object.

## 603 2.3 Object Relationships

604 IPP objects have relationships that are maintained persistently along with the persistent storage of the object  
605 attributes.

606 A Printer object can represent either one or more physical output devices or a logical device which  
607 "processes" jobs but never actually uses a physical output device to put marks on paper. Examples of  
608 logical devices include a Web page publisher or a gateway into an online document archive or repository.  
609 A Printer object contains zero or more Job objects.

610 A Job object is contained by exactly one Printer object, however the identical document data associated  
611 with a Job object could be sent to either the same or a different Printer object. In this case, a second Job  
612 object would be created which would be almost identical to the first Job object, however it would have new  
613 (different) Job object identifiers (see section 2.4).

614 A Job object is either empty (before any documents have been added) or contains one or more documents.  
615 If the contained document is a stream of document data, that stream can be contained in only one document.  
616 However, there can be identical copies of the stream in other documents in the same or different Job  
617 objects. If the contained document is just a reference to a stream of document data, other documents (in the  
618 same or different Job object(s)) may contain the same reference.

## 619 2.4 Object Identity

620 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [RFC2396] so that they  
621 can be persistently and unambiguously referenced. The notion of a URI is a useful concept, however, until  
622 the notion of URI is more stable (i.e., defined more completely and deployed more widely), it is expected  
623 that the URIs used for IPP objects will actually be URLs [RFC2396]. Since every URL is a specialized  
624 form of a URI, even though the more generic term URI is used throughout the rest of this document, its  
625 usage is intended to cover the more specific notion of URL as well.

626 An administrator configures Printer objects to either support or not support authentication and/or message  
627 privacy using ~~SSL3~~ [Transport Layer Security \(TLS\) \[RFC2246\]](#) (the mechanism for security  
628 configuration is outside the scope of ~~IPP/1.0~~; [this IPP/1.1 document](#)). In some situations, both types of  
629 connections (both authenticated and unauthenticated) can be established using a single communication  
630 channel that has some sort of negotiation mechanism. In other situations, multiple communication channels  
631 are used, one for each type of security configuration. Section 8 provides a full description of all security  
632 considerations and configurations.

633 If a Printer object supports more than one communication channel, some or all of those channels might  
634 support and/or require different security mechanisms. In such cases, an administrator could expose the  
635 simultaneous support for these multiple communication channels as multiple URIs for a single Printer  
636 object where each URI represents one of the communication channels to the Printer object. To support this  
637 flexibility, the IPP Printer object type defines a multi-valued identification attribute called the "printer-uri-  
638 supported" attribute. It **MUST** contain at least one URI. It **MAY** contain more than one URI. That is,  
639 every Printer object will have at least one URI that identifies at least one communication channel to the  
640 Printer object, but it may have more than one URI where each URI identifies a different communication  
641 channel to the Printer object. The "printer-uri-supported" attribute has ~~at two~~ companion attributes, the "uri-  
642 security-supported" ~~attribute and the attribute, that has~~ ["uri-authentication-supported"](#). ~~Both have~~ the same  
643 cardinality as "printer-uri-supported". The purpose of the "uri-security-supported" attribute is to indicate  
644 the security mechanisms (if any) used for each URI listed in "printer-uri-supported". ~~The purpose of the~~  
645 ["uri-authentication-supported" attribute is to indicate the authentication mechanisms \(if any\) used for each](#)  
646 [URI listed in "printer-uri-supported"](#). These ~~two~~~~three~~ attributes are fully described in sections 4.4.1 ~~and~~,  
647 4.4.2, ~~and~~ 4.4.3. **Issue 2**

648 When a job is submitted to the Printer object via a create request, the client supplies only a single Printer  
649 object URI. The client supplied Printer object URI **MUST** be one of the values in the "printer-uri-  
650 supported" Printer attribute.

651 ~~Note:~~ ~~IPP/1.0~~ [IPP/1.1](#) does not specify how the client obtains the client supplied URI, but it is  
652 **RECOMMENDED** that a Printer object be registered as an entry in a directory service. End-users and  
653 programs can then interrogate the directory searching for Printers. Section 16 defines a generic schema for  
654 Printer object entries in the directory service and describes how the entry acts as a bridge to the actual IPP  
655 Printer object. The entry in the directory that represents the IPP Printer object includes the possibly many  
656 URIs for that Printer object as values in one its attributes.

657 When a client submits a create request to the Printer object, the Printer object validates the request and  
658 creates a new Job object. The Printer object assigns the new Job object a URI which is stored in the "job-

659 uri" Job attribute. This URI is then used by clients as the target for subsequent Job operations. The Printer  
660 object generates a Job URI based on its configured security policy and the URI used by the client in the  
661 create request.

662 For example, consider a Printer object that supports both a communication channel secured by the use of  
663 SSL3 (using HTTP over SSL3 with an "https" schemed URI) and another open communication channel that  
664 is not secured with SSL3 (using a simple "http" schemed URI). If a client were to submit a job using the  
665 secure URI, the Printer object would assign the new Job object a secure URI as well. If a client were to  
666 submit a job using the open-channel URI, the Printer would assign the new Job object an open-channel  
667 URI.

668 In addition, the Printer object also populates the Job object's "job-printer-uri" attribute. This is a reference  
669 back to the Printer object that created the Job object. If a client only has access to a Job object's "job-uri"  
670 identifier, the client can query the Job's "job-printer-uri" attribute in order to determine which Printer object  
671 created the Job object. If the Printer object supports more than one URI, the Printer object picks the one  
672 URI supplied by the client when creating the job to build the value for and to populate the Job's "job-  
673 printer-uri" attribute.

674 Allowing Job objects to have URIs allows for flexibility and scalability. For example, in some  
675 implementations, the Printer object might create Jobs that are processed in the same local environment as  
676 the Printer object itself. In this case, the Job URI might just be a composition of the Printer's URI and some  
677 unique component for the Job object, such as the unique 32-bit positive integer mentioned later in this  
678 paragraph. In other implementations, the Printer object might be a central clearing-house for validating all  
679 Job object creation requests, but the Job object itself might be created in some environment that is remote  
680 from the Printer object. In this case, the Job object's URI may have no physical-location relationship at all  
681 to the Printer object's URI. Again, the fact that Job objects have URIs allows for flexibility and scalability,  
682 however, many existing printing systems have local models or interface constraints that force print jobs to  
683 be identified using only a 32-bit positive integer rather than an independent URI. This numeric Job ID is  
684 only unique within the context of the Printer object to which the create request was originally submitted.  
685 Therefore, in order to allow both types of client access to IPP Job objects (either by Job URI or by numeric  
686 Job ID), when the Printer object successfully processes a create request and creates a new Job object, the  
687 Printer object MUST generate both a Job URI and a Job ID. The Job ID (stored in the "job-id" attribute)  
688 only has meaning in the context of the Printer object to which the create request was originally submitted.  
689 This requirement to support both Job URIs and Job IDs allows all types of clients to access Printer objects  
690 and Job objects no matter the local constraints imposed on the client implementation.

691 In addition to identifiers, Printer objects and Job objects have names ("printer-name" and "job-name"). An  
692 object name NEED NOT be unique across all instances of all objects. A Printer object's name is chosen and  
693 set by an administrator through some mechanism outside the scope of [IPP/1.0](#). [this IPP/1.1 document](#). A  
694 Job object's name is optionally chosen and supplied by the IPP client submitting the job. If the client does  
695 not supply a Job object name, the Printer object generates a name for the new Job object. In all cases, the  
696 name only has local meaning.

697 To summarize:

698 - Each Printer object is identified with one or more URIs. The Printer's "printer-uri-supported" attribute  
699 contains the URI(s).

- 700 - The Printer object's "uri-security-supported" attribute identifies the communication channel security  
701 protocols that may or may not have been configured for the various Printer object URIs (e.g.,  
702 'ssl3', 'tls' or 'none').
- 703 - The Printer object's "uri-authentication-supported" attribute identifies the authentication mechanisms  
704 that may or may not have been configured for the various Printer object URIs (e.g., 'digest' or  
705 'none').
- 706 - Each Job object is identified with a Job URI. The Job's "job-uri" attribute contains the URI.  
707 - Each Job object is also identified with Job ID which is a 32-bit, positive integer. The Job's "job-id"  
708 attribute contains the Job ID. The Job ID is only unique within the context of the Printer object  
709 which created the Job object.
- 710 - Each Job object has a "job-printer-uri" attribute which contains the URI of the Printer object that was  
711 used to create the Job object. This attribute is used to determine the Printer object that created a Job  
712 object when given only the URI for the Job object. This linkage is necessary to determine the  
713 languages, charsets, and operations which are supported on that Job (the basis for such support  
714 comes from the creating Printer object).
- 715 - Each Printer object has a name (which is not necessarily unique). The administrator chooses and sets  
716 this name through some mechanism outside the scope of IPP/1.0 itself, this IPP/1.1 document. The  
717 Printer object's "printer-name" attribute contains the name.
- 718 - Each Job object has a name (which is not necessarily unique). The client optionally supplies this name  
719 in the create request. If the client does not supply this name, the Printer object generates a name for  
720 the Job object. The Job object's "job-name" attribute contains the name.

### 721 3. IPP Operations

722 IPP objects support operations. An operation consists of a request and a response. When a client  
723 communicates with an IPP object, the client issues an operation request to the URI for that object.  
724 Operation requests and responses have parameters that identify the operation. Operations also have  
725 attributes that affect the run-time characteristics of the operation (the intended target, localization  
726 information, etc.). These operation-specific attributes are called operation attributes (as compared to object  
727 attributes such as Printer object attributes or Job object attributes). Each request carries along with it any  
728 operation attributes, object attributes, and/or document data required to perform the operation. Each  
729 request requires a response from the object. Each response indicates success or failure of the operation with  
730 a status code as a response parameter. The response contains any operation attributes, object attributes,  
731 and/or status messages generated during the execution of the operation request.

732 This section describes the semantics of the IPP operations, both requests and responses, in terms of the  
733 parameters, attributes, and other data associated with each operation.

734 The IPP/1.0IPP/1.1 Printer operations are:

- 735 Print-Job (section 3.2.1)  
736 Print-URI (section 3.2.2)  
737 Validate-Job (section 3.2.3)  
738 Create-Job (section 3.2.4)  
739 Get-Printer-Attributes (section 3.2.5)

740 Get-Jobs (section 3.2.6)  
741 [Pause-Printer \(section 3.3.5\)](#)  
742 [Resume-Printer \(section 3.3.6\)](#)  
743 [Purge-Jobs \(section 3.3.7\)](#)  
744

745 The Job operations are:

746 Send-Document (section 3.3.1)  
747 Send-URI (section 3.3.2)  
748 Cancel-Job (section 3.3.3)  
749 Get-Job-Attributes (section 3.3.4)  
750 [Hold-Job \(section 3.3.5\)](#)  
751 [Release-Job \(section 3.3.6\)](#)  
752 [Restart-Job \(section 3.3.7\)](#)  
753

754 The Send-Document and Send-URI Job operations are used to add a new document to an existing multi-  
755 document Job object created using the Create-Job operation.

## 756 3.1 Common Semantics

757 All IPP operations require some common parameters and operation attributes. These common elements  
758 and their semantic characteristics are defined and described in more detail in the following sections.

### 759 3.1.1 Required Parameters

760 Every operation request contains the following REQUIRED parameters:

- 761 - a "version-number",
  - 762 - an "operation-id",
  - 763 - a "request-id", and
  - 764 - the attributes that are REQUIRED for that type of request.
- 765

766 Every operation response contains the following REQUIRED parameters:

- 767 - a "version-number",
  - 768 - a "status-code",
  - 769 - the "request-id" that was supplied in the corresponding request, and
  - 770 - the attributes that are REQUIRED for that type of response.
- 771

772 The ~~encoding and transport~~ [Encoding and Transport](#) document [IPP-PRO] defines special rules for the  
773 encoding of these parameters. All other operation elements are represented using the more generic  
774 encoding rules for attributes and groups of attributes.

## 775 3.1.2 Operation IDs and Request IDs

776 Each IPP operation request includes an identifying "operation-id" value. Valid values are defined in the  
777 "operations-supported" Printer attribute section (see section 4.4.15). The client specifies which operation is  
778 being requested by supplying the correct "operation-id" value.

779 In addition, every invocation of an operation is identified by a "request-id" value. For each request, the  
780 client chooses the "request-id" which MUST be an integer (possibly unique depending on client  
781 requirements) in the range from 1 to  $2^{31} - 1$  (inclusive). This "request-id" allows clients to manage  
782 multiple outstanding requests. The receiving IPP object copies all 32-bits of the client-supplied "request-id"  
783 attribute into the response so that the client can match the response with the correct outstanding request,  
784 even if the "request-id" is out of range. If the request is terminated before the complete "request-id" is  
785 received, the IPP object rejects the request and returns a response with a "request-id" of 0.

786 Note: In some cases, the transport protocol underneath IPP might be a connection oriented protocol that  
787 would make it impossible for a client to receive responses in any order other than the order in which the  
788 corresponding requests were sent. In such cases, the "request-id" attribute would not be essential for correct  
789 protocol operation. However, in other mappings, the operation responses can come back in any order. In  
790 these cases, the "request-id" would be essential.

## 791 3.1.3 Attributes

792 Operation requests and responses are both composed of groups of attributes and/or document data. The  
793 attributes groups are:

- 794 - Operation Attributes: These attributes are passed in the operation and affect the IPP object's behavior  
795 while processing the operation request and may affect other attributes or groups of attributes. Some  
796 operation attributes describe the document data associated with the print job and are associated with  
797 new Job objects, however most operation attributes do not persist beyond the life of the operation.  
798 The description of each operation attribute includes conformance statements indicating which  
799 operation attributes are REQUIRED and which are OPTIONAL for an IPP object to support and  
800 which attributes a client MUST supply in a request and an IPP object MUST supply in a response.
- 801 - Job Template Attributes: These attributes affect the processing of a job. A client OPTIONALLY  
802 supplies Job Template Attributes in a create request, and the receiving object MUST be prepared to  
803 receive all supported attributes. The Job object can later be queried to find out what Job Template  
804 attributes were originally requested in the create request, and such attributes are returned in the  
805 response as Job Object Attributes. The Printer object can be queried about its Job Template  
806 attributes to find out what type of job processing capabilities are supported and/or what the default  
807 job processing behaviors are, though such attributes are returned in the response as Printer Object  
808 Attributes. The "ipp-attribute-fidelity" operation attribute affects processing of all client-supplied  
809 Job Template attributes (see sections 3.2.1.2 and 15 for a full description of "ipp-attribute-fidelity"  
810 and its relationship to other attributes).
- 811 - Job Object Attributes: These attributes are returned in response to a query operation directed at a Job  
812 object.
- 813 - Printer Object Attributes: These attributes are returned in response to a query operation directed at a  
814 Printer object.

815 - Unsupported Attributes: In a create request, the client supplies a set of Operation and Job Template  
816 attributes. If any of these attributes or their values is unsupported by the Printer object, the Printer  
817 object returns the set of unsupported attributes in the response. Sections 3.1.7, 3.2.1.2, and 15 give  
818 a full description of how Job Template attributes supplied by the client in a create request are  
819 processed by the Printer object and how unsupported attributes are returned to the client. Because  
820 of extensibility, any IPP object might receive a request that contains new or unknown attributes or  
821 values for which it has no support. In such cases, the IPP object processes what it can and returns  
822 the unsupported attributes in the response. The Unsupported Attribute group is defined for all  
823 operation responses for returning unsupported attributes that the client supplied in the request.  
824

825 Later in this section, each operation is formally defined by identifying the allowed and expected groups of  
826 attributes for each request and response. The model identifies a specific order for each group in each  
827 request or response, but the attributes within each group may be in any order, unless specified otherwise.

828 Each attribute specificationdefinition includes the attribute's name followed by the name of its attribute  
829 syntax(es) in parentheses. In addition, each 'integer' attribute is followed by the allowed range in  
830 parentheses, (m:n), for values of that attribute. Each 'text' or 'name' attribute is followed by the maximum  
831 size in octets in parentheses, (size), for values of that attribute. For more details on attribute syntax notation,  
832 see the descriptions of these attributes syntaxes in section 4.1.

833 Note: Document data included in the operation is not strictly an attribute, but it is treated as a special  
834 attribute group for ordering purposes. The only operations that support supplying the document data within  
835 an operation request are Print-Job and Send-Document. There are no operation responses that include  
836 document data.

837 ~~Note:~~ Some operations are REQUIRED for IPP objects to support; the others are OPTIONAL (see section  
838 5.2.2). Therefore, before using an OPTIONAL operation, a client SHOULD first use the REQUIRED Get-  
839 Printer-Attributes operation to query the Printer's "operations-supported" attribute in order to determine  
840 which OPTIONAL Printer and Job operations are actually supported. The client SHOULD NOT use an  
841 OPTIONAL operation that is not supported. When an IPP object receives a request to perform an operation  
842 it does not support, it returns the 'server-error-operation-not-supported' status code (see section 13.1.5.2).  
843 An IPP object is non-conformant if it does not support a REQUIRED operation.

#### 844 3.1.4 Character Set and Natural Language Operation Attributes

845 Some Job and Printer attributes have values that are text strings and names intended for human  
846 understanding rather than machine understanding (see the 'text' and 'name' attribute syntax descriptions in  
847 section 4.1). The following sections describe two special Operation Attributes called "attributes-charset"  
848 and "attributes-natural-language". These attributes are always part of the Operation Attributes group. For  
849 most attribute groups, the order of the attributes within the group is not important. However, for these two  
850 attributes within the Operation Attributes group, the order is critical. The "attributes-charset" attribute  
851 MUST be the first attribute in the group and the "attributes-natural-language" attribute MUST be the second  
852 attribute in the group. In other words, these attributes MUST be supplied in every IPP request and  
853 response, they MUST come first in the group, and MUST come in the specified order. For job creation  
854 operations, the IPP Printer implementation saves these two attributes with the new Job object as Job

855 Description attributes. For the sake of brevity in this document, these operation attribute descriptions are  
856 not repeated with every operation request and response, but have a reference back to this section instead.

#### 857 3.1.4.1 Request Operation Attributes

858 The client MUST supply and the Printer object MUST support the following REQUIRED operation  
859 attributes in every ~~IPP/4.0~~IPP/1.1 operation request:

860 "attributes-charset" (charset):

861 This operation attribute identifies the charset (coded character set and encoding method) used by  
862 any 'text' and 'name' attributes that the client is supplying in this request. It also identifies the  
863 charset that the Printer object MUST use (if supported) for all 'text' and 'name' attributes and status  
864 messages that the Printer object returns in the response to this request. See Sections 4.1.1 and 4.1.2  
865 for the ~~specification~~definition of the 'text' and 'name' attribute syntaxes.

866  
867 All clients and IPP objects MUST support the 'utf-8' charset [~~RFC2044~~RFC2279] and MAY  
868 support additional charsets provided that they are registered with IANA [IANA-CS]. If the Printer  
869 object does not support the client supplied charset value, the Printer object MUST reject the request,  
870 set the "attributes-charset" to 'utf-8' in the response, and return the 'client-error-charset-not-  
871 supported' status code and any 'text' or 'name' attributes using the 'utf-8' charset. The Printer **NEED**  
872 **NOT return any attributes in the Unsupported Attributes Group (See sections 3.1.7 and 3.2.1.2).**  
873 **The Printer** object MUST indicate the charset(s) supported as the values of the "charset-supported"  
874 Printer attribute (see Section 4.4.18), so that the client can query to determine which charset(s) are  
875 supported.

876  
877 Note to client implementers: Since IPP objects are only required to support the 'utf-8' charset, in  
878 order to maximize interoperability with multiple IPP object implementations, a client may want to  
879 supply 'utf-8' in the "attributes-charset" operation attribute, even though the client is only passing  
880 and able to present a simpler charset, such as US-ASCII or ISO-8859-1. Then the client will have to  
881 filter out (or charset convert) those characters that are returned in the response that it cannot present  
882 to its user. On the other hand, if both the client and the IPP objects also support a charset in  
883 common besides utf-8, the client may want to use that charset in order to avoid charset conversion  
884 or data loss.

885  
886 See the 'charset' attribute syntax description in Section 4.1.7 for the syntax and semantic  
887 interpretation of the values of this attribute and for example values.

888  
889 "attributes-natural-language" (naturalLanguage):

890 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
891 the client is supplying in this request. This attribute also identifies the natural language that the  
892 Printer object SHOULD use for all 'text' and 'name' attributes and status messages that the Printer  
893 object returns in the response to this request.

894  
895 There are no REQUIRED natural languages required for the Printer object to support. However, the  
896 Printer object's "generated-natural-language-supported" attribute identifies the natural languages  
897 supported by the Printer object and any contained Job objects for all text strings generated by the

898 IPP object. A client MAY query this attribute to determine which natural language(s) are supported  
899 for generated messages.

900

901 For any of the attributes for which the Printer object generates text, i.e., for the "job-state-message",  
902 "printer-state-message", and status messages (see Section 3.1.6), the Printer object MUST be able to  
903 generate these text strings in any of its supported natural languages. If the client requests a natural  
904 language that is not supported, the Printer object MUST return these generated messages in the  
905 Printer's configured natural language as specified by the Printer's "natural-language-configured"  
906 attribute" (see Section 4.4.19).

907

908 For other 'text' and 'name' attributes supplied by the client, authentication system, operator, system  
909 administrator, or manufacturer (i.e., for "job-originating-user-name", "printer-name" (name),  
910 "printer-location" (text), "printer-info" (text), and "printer-make-and-model" (text)), the Printer  
911 object is only required to support the configured natural language of the Printer identified by the  
912 Printer object's "natural-language-configured" attribute, though support of additional natural  
913 languages for these attributes is permitted.

914

915 For any 'text' or 'name' attribute in the request that is in a different natural language than the value  
916 supplied in the "attributes-natural-language" operation attribute, the client MUST use the Natural  
917 Language Override mechanism (see sections 4.1.1.2 and 4.1.2.2) for each such attribute value  
918 supplied. The client MAY use the Natural Language Override mechanism redundantly, i.e., use it  
919 even when the value is in the same natural language as the value supplied in the "attributes-natural-  
920 language" operation attribute of the request.

921

922 The IPP object MUST accept any natural language and any Natural Language Override, whether the  
923 IPP object supports that natural language or not (and independent of the value of the "ipp-attribute-  
924 fidelity" Operation attribute). That is the IPP object accepts all client supplied values no matter  
925 what the values are in the Printer object's "generated-natural-language-supported" attribute. That  
926 attribute, "generated-natural-language-supported", only applies to generated messages, not client  
927 supplied messages. The IPP object MUST remember that natural language for all client-supplied  
928 attributes, and when returning those attributes in response to a query, the IPP object MUST indicate  
929 that natural language.

930

931 Each value whose attribute syntax type is ~~'text' or 'name'~~'text' or 'name' (see sections 4.1.1 and  
932 4.1.2) has an Associated Natural-Language. This document does not specify how this association is  
933 stored in a Printer or Job object. When such a value is encoded in a request or response, the natural  
934 language is either implicit or explicit:

935

- 936 – In the implicit case, the value contains only the text/name value, and the language is  
937 specified by the ~~"attributes-natural-language"~~"attributes-natural-language" operation  
938 attribute in the request or response (see sections 4.1.1.1 textWithoutLanguage and 4.1.2.1  
939 nameWithoutLanguage).

940

- 941           – In the explicit case (also known as the Natural-Language Override case), the value contains  
942 both the language and the text/name value (see sections 4.1.1.2 textWithLanguage and  
943 4.1.2.2 nameWithLanguage).

944  
945 For example, the "job-name" attribute MAY be supplied by the client in a create request. The text  
946 value for this attribute will be in the natural language identified by the "attribute-natural-language"  
947 attribute, or if different, as identified by the Natural Language Override mechanism. If supplied, the  
948 IPP object will use the value of the "job-name" attribute to populate the Job object's "job-name"  
949 attribute. Whenever any client queries the Job object's "job-name" attribute, the IPP object returns  
950 the attribute as stored and uses the Natural Language Override mechanism to specify the natural  
951 language, if it is different from that reported in the "attributes-natural-language" operation attribute  
952 of the response. The IPP object MAY use the Natural Language Override mechanism redundantly,  
953 i.e., use it even when the value is in the same natural language as the value supplied in the  
954 "attributes-natural-language" operation attribute of the response.

955  
956 An IPP object MUST NOT reject a request based on a supplied natural language in an "attributes-  
957 natural-language" Operation attribute or in any attribute that uses the Natural Language Override.

958  
959 See the 'naturalLanguage' attribute syntax description in section 4.1.8 for the syntax and semantic  
960 interpretation of the values of this attribute and for example values.

961  
962 Clients SHOULD NOT supply 'text' or 'name' attributes that use an illegal combination of natural language  
963 and charset. For example, suppose a Printer object supports charsets 'utf-8', 'iso-8859-1', and 'iso-8859-7'.  
964 Suppose also, that it supports natural languages 'en' (English), 'fr' (French), and 'el' (Greek). Although the  
965 Printer object supports the charset 'iso-8859-1' and natural language 'el', it probably does not support the  
966 combination of Greek text strings using the 'iso-8859-1' charset. The Printer object handles this apparent  
967 incompatibility differently depending on the context in which it occurs:

- 968     - In a create request: If the client supplies a text or name attribute (for example, the "job-name"  
969       operation attribute) that uses an apparently incompatible combination, it is a client choice that does  
970       not affect the Printer object or its correct operation. Therefore, the Printer object simply accepts the  
971       client supplied value, stores it with the Job object, and responds back with the same combination  
972       whenever the client (or any client) queries for that attribute.
- 973     -In a query-type operation, like Get-Printer-Attributes: If the client requests an apparently incompatible  
974       combination, the Printer object responds (as described in section 3.1.4.2) using the Printer's  
975       configured natural language rather than the natural language requested by the client.

976  
977 In either case, the Printer object does not reject the request because of the apparent incompatibility. The  
978 potential incompatible combination of charset and natural language can occur either at the global operation  
979 level or at the Natural Language Override attribute-by-attribute level. In addition, since the response always  
980 includes explicit charset and natural language information, there is never any question or ambiguity in how  
981 the client interprets the response.

## 982 3.1.4.2 Response Operation Attributes

983 The Printer object **MUST** supply and the client **MUST** support the following **REQUIRED** operation  
984 attributes in every ~~IPP/1.0~~[IPP/1.1](#) operation response:

985 "attributes-charset" (charset):

986 This operation attribute identifies the charset used by any 'text' and 'name' attributes that the Printer  
987 object is returning in this response. The value in this response **MUST** be the same value as the  
988 "attributes-charset" operation attribute supplied by the client in the request. If this is not possible  
989 (i.e., the charset requested is not supported), the request would have been rejected. See "attributes-  
990 charset" described in Section 3.1.4.1 above.

991  
992 If the Printer object supports more than just the 'utf-8' charset, the Printer object **MUST** be able to  
993 code convert between each of the charsets supported on a highest fidelity possible basis in order to  
994 return the 'text' and 'name' attributes in the charset requested by the client. However, some  
995 information loss **MAY** occur during the charset conversion depending on the charsets involved. For  
996 example, the Printer object may convert from a UTF-8 'a' to a US-ASCII 'a' (with no loss of  
997 information), from an ISO Latin 1 CAPITAL LETTER A WITH ACUTE ACCENT to US-ASCII  
998 'A' (losing the accent), or from a UTF-8 Japanese Kanji character to some ISO Latin 1 error  
999 character indication such as '?', decimal code equivalent, or to the absence of a character, depending  
1000 on implementation.

1001  
1002 ~~Note:~~ Whether an implementation that supports more than one charset stores the data in the charset  
1003 supplied by the client or code converts to one of the other supported charsets, depends on  
1004 implementation. The strategy should try to minimize loss of information during code conversion.  
1005 On each response, such an implementation converts from its internal charset to that requested.  
1006

1007 "attributes-natural-language" (naturalLanguage):

1008 This operation attribute identifies the natural language used by any 'text' and 'name' attributes that  
1009 the IPP object is returning in this response. Unlike the "attributes-charset" operation attribute, the  
1010 IPP object **NEED NOT** return the same value as that supplied by the client in the request. The IPP  
1011 object **MAY** return the natural language of the Job object or the Printer's configured natural  
1012 language as identified by the Printer object's "natural-language-configured" attribute, rather than the  
1013 natural language supplied by the client. For any 'text' or 'name' attribute or status message in the  
1014 response that is in a different natural language than the value returned in the "attributes-natural-  
1015 language" operation attribute, the IPP object **MUST** use the Natural Language Override mechanism  
1016 (see sections 4.1.1.2 and 4.1.2.2) on each attribute value returned. The IPP object **MAY** use the  
1017 Natural Language Override mechanism redundantly, i.e., use it even when the value is in the same  
1018 natural language as the value supplied in the "attributes-natural-language" operation attribute of the  
1019 response.

## 1020 3.1.5 Operation Targets

1021 All IPP operations are directed at IPP objects. For Printer operations, the operation is always directed at a  
1022 Printer object using one of its URIs (i.e., one of the values in the Printer object's "printer-uri-supported"  
1023 attribute). Even if the Printer object supports more than one URI, the client supplies only one URI as the

1024 target of the operation. The client identifies the target object by supplying the correct URI in the "printer-  
1025 uri (uri)" operation attribute.

1026 For Job operations, the operation is directed at either:

- 1027 - The Job object itself using the Job object's URI. In this case, the client identifies the target object by  
1028 supplying the correct URI in the "job-uri (uri)" operation attribute.
- 1029 - The Printer object that created the Job object using both the Printer object's URI and the Job object's  
1030 Job ID. Since the Printer object that created the Job object generated the Job ID, it MUST be able to  
1031 correctly associate the client supplied Job ID with the correct Job object. The client supplies the  
1032 Printer object's URI in the "printer-uri (uri)" operation attribute and the Job object's Job ID in the  
1033 "job-id (integer(1:MAX))" operation attribute.

1034

1035 If the operation is directed at the Job object directly using the Job object's URI, the client MUST NOT  
1036 include the redundant "job-id" operation attribute.

1037 The operation target attributes are REQUIRED operation attributes that MUST be included in every  
1038 operation request. Like the charset and natural language attributes (see section 3.1.4), the operation target  
1039 attributes are specially ordered operation attributes. In all cases, the operation target attributes immediately  
1040 follow the "attributes-charset" and "attributes-natural-language" attributes within the operation attribute  
1041 group, however the specific ordering rules are:

- 1042 - In the case where there is only one operation target attribute (i.e., either only the "printer-uri" attribute  
1043 or only the "job-uri" attribute), that attribute MUST be the third attribute in the operation attributes  
1044 group.
- 1045 - In the case where Job operations use two operation target attributes (i.e., the "printer-uri" and "job-id"  
1046 attributes), the "printer-uri" attribute MUST be the third attribute and the "job-id" attribute MUST  
1047 be the fourth attribute.

1048

1049 In all cases, the target URIs contained within the body of IPP operation requests and responses must be in  
1050 absolute format rather than relative format (a relative URL identifies a resource with the scope of the HTTP  
1051 server, but does not include scheme, host or port).

1052 The following rules apply to the use of port numbers in URIs that identify IPP objects:

- 1053 1. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1054 number is specified within the URI, then that port number MUST be used by the client to contact  
1055 the IPP object.
- 1056 2. If the URI scheme allows the port number to be explicitly included in the URI string, and a port  
1057 number is not specified within the URI, then default port number implied by that URI scheme  
1058 MUST be used by the client to contact the IPP object.
- 1059 3. If the URI scheme does not allow an explicit port number to be specified within the URI, then the  
1060 default port number implied by that URI MUST be used by the client to contact the IPP object.

1061  
1062  
1063

1064 Note: The IPP ~~encoding and transport~~ "Encoding and Transport" document [IPP-PRO] shows a mapping of  
1065 IPP onto HTTP/1.1 and defines a new default port number for using IPP over HTTP/1.1.

### 1066 3.1.6 Operation Response Status Codes and Status Messages

1067 Every operation response includes a REQUIRED "status-code" parameter and an OPTIONAL "status-  
1068 message" operation attribute, and an OPTIONAL "detailed-status-message" operation attribute. The Print-  
1069 URI and Send-URI response MAY include an OPTIONAL "document-access-error" operation attribute.

#### 1070 3.1.6.1 "status-code" (type2 enum)

1071 The REQUIRED "status-code" parameter provides information on the processing of a request.

1072 The status code is intended for use by automata. A client implementation of IPP SHOULD convert status  
1073 code values into any localized message that has semantic meaning to the end user.

1074 The "status-code" value is a numeric value that has semantic meaning. The "status-code" syntax is similar  
1075 to a "type2 enum" (see section 4.1 on "Attribute Syntaxes") except that values can range only from 0x0000  
1076 to 0x7FFF. Section 13 describes the status codes, assigns the numeric values, and suggests a corresponding  
1077 status message for each status code for use by the client when the user's natural language is English.

1078 If the Printer performs an operation with no errors and it encounters no problems, it MUST return the status  
1079 code 'successful-ok' in the response. See section 13.

1080 If the client supplies unsupported values for the following parameters or Operation attributes, the Printer  
1081 object MUST reject the operation, NEED NOT return the unsupported attribute value in the Unsupported  
1082 Attributes group, and MUST return the indicated status code:

<u>Parameter/Attribute</u>	<u>Status code</u>
<u>version-number</u>	<u>server-error-version-not-supported</u>
<u>operation-id</u>	<u>server-error-operation-not-supported</u>
<u>attributes-charset</u>	<u>client-error-charset-not-supported</u>
<u>compression</u>	<u>client-error-compression-not-supported</u>
<u>document-format</u>	<u>client-error-document-format-not-supported</u>
<u>document-uri</u>	<u>client-error-uri-scheme-not-supported, client-error-document-access-error</u>

1083  
1084 If the client supplies unsupported values for other attributes, or unsupported attributes, the Printer returns  
1085 the status code defined in section 3.1.7 on Unsupported Attributes. Issue 18

#### 1086 3.1.6.2 "status-message" (text(255))

1087 ~~A~~ The OPTIONAL "status-message" operation attribute provides a short textual description of the status of  
1088 the operation. The "status-message" attribute's syntax is "text(255)", so the maximum length is 255 octets  
1089 (see section 4.1.1). ~~†~~ The status message is intended for the human end user. If a response does include a

1090 "status-message" attribute, an IPP client NEED NOT examine or display the messages, however it  
1091 SHOULD do so in some implementation specific manner. The "status-message" is especially useful for a  
1092 later version of a Printer object to return as supplemental information for the human user to accompany a  
1093 status code that an earlier version of a client might not understand.

1094 If the Printer object supports the "status-message" operation attribute, the Printer object MUST be able to  
1095 generate this message in any of the natural languages identified by the Printer object's "generated-natural-  
1096 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in section  
1097 3.1.4.1. Section 13 suggests the text for the status message returned by the Printer for use with the English  
1098 natural language.

1099 As described in section 3.1.4.1 for any returned 'text' attribute, if there is a choice for generating this  
1100 message, the Printer object uses the natural language indicated by the value of the "attributes-natural-  
1101 language" in the client request if supported, otherwise the Printer object uses the value in the Printer  
1102 object's own "natural-language-configured" attribute.

1103 If the Printer object supports the "status-message" operation attribute, it SHOULD use the REQUIRED 'utf-  
1104 8' charset to return a status message for the following error status codes (see section 13): 'client-error-bad-  
1105 request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-  
1106 supported', and 'server-error-version-not-supported'. In this case, it MUST set the value of the "attributes-  
1107 charset" operation attribute to 'utf-8' in the error response.

### 1108 3.1.6.3 "detailed-status-message" (text(MAX)) Issue 35

1109 The OPTIONAL "detailed-status-message" operation attribute provides additional more detailed technical  
1110 and implementation-specific information about the operation. The "detailed-status-message" attribute's  
1111 syntax is "text(MAX)", so the maximum length is 1023 octets (see section 4.1.1). If the Printer objects  
1112 supports the "detailed-status-message" operation attribute, neither the Printer nor the client localizes the  
1113 message, since it is intended for use by the system administrator or other experienced technical persons.  
1114 Clients MUST NOT attempt to parse the value of this attribute. See the "document-access-error" operation  
1115 attribute (section 3.1.6.4) for additional errors that a program can process.

### 1116 3.1.6.4 "document-access-error" (text(MAX)) Issue 35

1117 This OPTIONAL operation attribute provides additional information about any document access errors  
1118 encountered by the Printer before it returned a response to the Print-URI (section 3.2.2) or Send-URI  
1119 (section 3.3.1) operation. For errors in the protocol identified by the URI scheme in the "document-uri"  
1120 operation attribute, such as 'http:' or 'ftp:', the error code is returned in parentheses, followed by the URI.  
1121 For example:

1122 (404) http://ftp.pwg.org/pub/pwg/ipp/new\_MOD/ipp-model-v11-990510.pdf  
1123

1124 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in  
1125 decimal.

1126 3.1.7 Unsupported Attributes

1127 The Unsupported Attributes group contains attributes that are not supported by the operation. This group is  
1128 primarily for the job creation operations, but all operations can return this group.

1129 A Printer object MUST include an Unsupported Attributes group in a response if the status code is one of  
1130 the following: 'successful-ok-ignored-or-substituted-attributes', 'successful-ok-conflicting-attributes', 'client-  
1131 error-attributes-or-values-not-supported' or 'client-error-conflicting-attributes'.

1132 If the status code is one of the four specified in the preceding paragraph, the Unsupported Attributes group  
1133 MUST contain all of those attributes and only those attributes that are:

- 1134 a. an Operation or Job Template attribute supplied in the request, and  
1135 b. unsupported by the printer. See below for details on the three categories "unsupported" attributes.  
1136 Issue 18, Issue 23, and Issue 27

1137 If the Printer object is not returning any Unsupported Attributes in the response, the Printer object  
1138 SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an  
1139 empty group.

1140 Unsupported attributes fall into three categories:

- 1141 1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or  
1142 value).
- 1143 2. The Printer object does support the attribute, but does not support some or all of the particular  
1144 attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those  
1145 attribute syntaxes or values in its corresponding "xxx-supported" attribute).
- 1146 3. The Printer object does support the attributes and values supplied, but the particular values are in  
1147 conflict with one another, because they violate a constraint, such as not being able to staple  
1148 transparencies.

1149 In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute with a  
1150 substituted value of 'unsupported'. This value's syntax type is "out-of-band" and its encoding is defined by  
1151 special rules for "out-of-band" values in the "Encoding and Transport" document [IPP-PRO]. Its value  
1152 indicates no support for the attribute itself (see the beginning of section 4.1). Issue 12

1153 In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the Printer  
1154 object simply returns the client-supplied attribute with the unsupported attribute syntaxes or values as  
1155 supplied by the client. This indicates support for the attribute, but no support for that particular attribute  
1156 syntax or value. If the client supplies a multi-valued attribute with more than one value and the Printer  
1157 object supports the attribute but only supports a subset of the client-supplied attribute syntaxes or values,  
1158 the Printer object MUST return only those attribute syntaxes or values that are unsupported.

1159 In the case of two (or more) supported attribute values that are in conflict with one another (although each  
1160 is supported independently, the values conflict when requested together within the same job), the Printer  
1161 object MUST return all the values that it ignores or substitutes to resolve the conflict, but not any of the  
1162 values that it is still using. The choice for exactly how to resolve the conflict is implementation dependent.  
1163 See sections 3.2.1.2 and 15. See The Implementer's Guide [IPP-IIG] for an example.

### 1164 3.1.8 Versions

1165 Each operation request and response carries with it a "version-number" parameter. Each value of the  
1166 "version-number" is in the form "X.Y" where X is the major version number and Y is the minor version  
1167 number. By including a version number in the client request, it allows the client to identify which version  
1168 of IPP it is interested in using, i.e., the version whose conformance requirements the client may be  
1169 depending upon the Printer to meet.

1170 If the IPP object does not support that major version number supplied by the client, i.e., the major version  
1171 field of the "version-number" parameter does not match any of the values of the Printer's "ipp-versions-  
1172 supported" (see section 4.4.14), the object MUST respond with a status code of 'server-error-version-not-  
1173 supported' along with the closest version number that is supported (see section 13.1.5.4). If the major  
1174 version number is supported, but the minor version number is not, the IPP object SHOULD accept and  
1175 attempt to perform the request (or reject the request if the operation is not supported), else it rejects the  
1176 request and returns the 'server-error-version-not-supported' status code. In all cases, the IPP object MUST  
1177 return the "version-number" that it supports that is closest to the version number supplied by the client in  
1178 the request.

1179 There is no version negotiation per se. However, if after receiving a 'server-error-version-not-supported'  
1180 status code from an IPP object, ~~there is nothing that prevents~~ a client SHOULD from trying again with a  
1181 different version number. A client MAY also determine the versions supported either from a directory that  
1182 conforms to Appendix E (see section 16) or by querying the Printer object's "ipp-versions-supported"  
1183 attribute (see section 4.4.14) to determine which versions are supported. Issue 36

1184 ~~In order to conform to IPP/1.0, an implementation~~ An IPP object implementation MUST support version  
1185 '1.1', i.e., meet the conformance requirements for IPP/1.1 as specified in this document and [IPP-PRO]. An  
1186 IPP object implementation SHOULD at least support version '1.0', i.e., meet the conformance requirements  
1187 for IPP/1.0 [RFC2566 and RFC2565]. Issue 36

1188 There is only one notion of "version number" that covers both IPP Model and IPP Protocol changes. Thus  
1189 the version number MUST change when introducing a new version of the Model and Semantics document  
1190 ~~[IPP-MOD]~~ (this document) or a new version of the "Encoding and Transport" document [IPP-PRO].

1191 Changes to the major version number of the Model and Semantics document indicate structural or syntactic  
1192 changes that make it impossible for older version of IPP clients and Printer objects to correctly parse and  
1193 correctly process the new or changed attributes, operations and responses. If the major version number  
1194 changes, the minor version numbers is set to zero. As an example, adding the REQUIRED "ipp-attribute-  
1195 fidelity" attribute to version '1.1' (if it had not been part of version '1.0'), would have required a change to  
1196 the major version number, since an IPP/1.0 Printer would not have processed a request with the correct  
1197 semantics that contained the "ipp-attribute-fidelity" attribute that it did not know about. Items that might

1198 affect the changing of the major version number include any changes to the Model and Semantics document  
1199 ~~IPP-MOD~~([this document](#)) or the "Encoding and Transport" document [IPP-PRO] itself, such as:

- 1200 - reordering of ordered attributes or attribute sets
- 1201 - changes to the syntax of existing attributes
- 1202 ~~-changing Operation or Job Template attributes from OPTIONAL to REQUIRED and vice versa~~
- 1203 ~~-adding REQUIRED (for an IPP object to support) operation attributes~~
- 1204 - adding REQUIRED (for an IPP object to support) operation attribute groups
- 1205 - adding values to existing [REQUIRED](#) operation attributes
- 1206 - adding REQUIRED operations

1207

1208 Changes to the minor version number indicate the addition of new features, attributes and attribute values  
1209 that may not be understood by all IPP objects, but which can be ignored if not understood. Items that might  
1210 affect the changing of the minor version number include any changes to the model objects and attributes but  
1211 not the encoding and transport rules [IPP-PRO] (except adding attribute syntaxes). Examples of such  
1212 changes are:

- 1213 - grouping all extensions not included in a previous version into a new version
- 1214 - adding new attribute values
- 1215 - adding new object attributes
- 1216 - adding OPTIONAL (for an IPP object to support) operation attributes (i.e., those attributes that an IPP  
1217 object can ignore without confusing clients)
- 1218 - adding OPTIONAL (for an IPP object to support) operation attribute groups (i.e., those attributes that  
1219 an IPP object can ignore without confusing clients)
- 1220 - adding new attribute syntaxes
- 1221 - adding OPTIONAL operations
- 1222 - changing Job Description attributes or Printer Description attributes from OPTIONAL to REQUIRED  
1223 or vice versa.
- 1224 ~~- adding OPTIONAL attribute syntaxes to an existing attribute.~~ [Issue 33](#)

1225 The encoding of ~~the "operation-id", the "version-number", the "status-code", and the "request-id"~~ MUST  
1226 NOT change over any version number (either major or minor). This rule guarantees that all future versions  
1227 will be backwards compatible with all previous versions (at least for checking ~~the "operation-id", the~~  
1228 ~~"version-number", and the "request-id"~~). In addition, any protocol elements (attributes, error codes, tags,  
1229 etc.) that are not carried forward from one version to the next are deprecated so that they can never be  
1230 reused with new semantics.

1231 Implementations that support a certain [major](#) version NEED NOT support ALL previous versions. As each  
1232 new [major](#) version is defined (through the release of a new [IPP specification document](#)), that [major](#)-version  
1233 will specify which previous [major](#) versions MUST [and which versions SHOULD](#) be supported in compliant  
1234 implementations. [Issue 36](#)

### 1235 3.1.9 Job Creation Operations

1236 In order to "submit a print job" and create a new Job object, a client issues a create request. A create  
1237 request is any one of following three operation requests:

- 1238 - The Print-Job Request: A client that wants to submit a print job with only a single document uses the  
1239 Print-Job operation. The operation allows for the client to "push" the document data to the Printer  
1240 object by including the document data in the request itself.  
1241
- 1242 - The Print-URI Request: A client that wants to submit a print job with only a single document (where  
1243 the Printer object "pulls" the document data instead of the client "pushing" the data to the Printer  
1244 object) uses the Print-URI operation. In this case, the client includes in the request only a URI  
1245 reference to the document data (not the document data itself).  
1246
- 1247 - The Create-Job Request: A client that wants to submit a print job with multiple documents uses the  
1248 Create-Job operation. This operation is followed by an arbitrary number of Send-Document and/or  
1249 Send-URI operations (each creating another document for the newly create Job object). The Send-  
1250 Document operation includes the document data in the request (the client "pushes" the document  
1251 data to the printer), and the Send-URI operation includes only a URI reference to the document data  
1252 in the request (the Printer "pulls" the document data from the referenced location). The last Send-  
1253 Document or Send-URI request for a given Job object includes a "last-document" operation attribute  
1254 set to 'true' indicating that this is the last request.  
1255

1256 Throughout this model [specification document](#), the term "create request" is used to refer to any of these  
1257 three operation requests.

1258 A Create-Job operation followed by only one Send-Document operation is semantically equivalent to a  
1259 Print-Job operation, however, for performance reasons, the client SHOULD use the Print-Job operation for  
1260 all single document jobs. Also, Print-Job is a REQUIRED operation (all implementations MUST support  
1261 it) whereas Create-Job is an OPTIONAL operation, hence some implementations might not support it.

1262 Job submission time is the point in time when a client issues a create request. The initial state of every Job  
1263 object is the 'pending', ~~or~~ 'pending-held', or 'processing' state (see section 4.3.7). **Issue 13** **When** the Printer  
1264 object begins processing the print job. ~~At this point in time~~, the Job object's state moves to 'processing'.  
1265 This is known as job processing time. There are validation checks that must be done at job submission time  
1266 and others that must be performed at job processing time.

1267 At job submission time and at the time a Validate-Job operation is received, the Printer MUST do the  
1268 following:

- 1269 1. Process the client supplied attributes and either accept or reject the request
- 1270 2. Validate the syntax of and support for the scheme of any client supplied URI

1271

1272 At job submission time the Printer object MUST validate whether or not the supplied attributes, attribute  
1273 syntaxes, and values are supported by matching them with the Printer object's corresponding "xxx-  
1274 supported" attributes. See section 3.1.7 for details. [IPP-IIG] presents suggested steps for an IPP object to  
1275 either accept or reject any request and additional steps for processing create requests.

1276 At job submission time the Printer object NEED NOT perform the validation checks reserved for job  
1277 processing time such as:

- 1278 1. Validating the document data  
1279 2. Validating the actual contents of any client supplied URI (resolve the reference and follow the link to  
1280 the document data)  
1281

1282 At job submission time, these additional job processing time validation checks are essentially useless, since  
1283 they require actually parsing and interpreting the document data, are not guaranteed to be 100% accurate,  
1284 and MUST be done, yet again, at job processing time. Also, in the case of a URI, checking for availability  
1285 at job submission time does not guarantee availability at job processing time. In addition, at job processing  
1286 time, the Printer object might discover any of the following conditions that were not detectable at job  
1287 submission time:

- 1288 - runtime errors in the document data,
  - 1289 - nested document data that is in an unsupported format,
  - 1290 - the URI reference is no longer valid (i.e., the server hosting the document might be down), or
  - 1291 - any other job processing error
- 1292

1293 At job submission time, a Printer object, especially a non-spooling Printer, MAY accept jobs that it does  
1294 not have enough space for. In such a situation, a Printer object MAY stop reading data from a client for an  
1295 indefinite period of time. A client MUST be prepared for a write operation to block for an indefinite period  
1296 of time (see section 5.1 on client conformance).

1297 When a Printer object has too little space for starting a new job, it MAY reject a new create request. In this  
1298 case, a Printer object MUST return a response (in reply to the rejected request) with a status-code of 'server-  
1299 error-busy' (see section 14.1.5.8) and it MAY close the connection before receiving all bytes of the  
1300 operation. A Printer SHOULD indicate that it is temporarily unable to accept jobs by setting the 'spool-  
1301 space-full' value in its "printer-state-reasons" attribute and removing the value when it can accept another  
1302 job (see section 4.4.12).

1303 When receiving a 'server-error-busy' status-code in an operation response, a client MUST be prepared for  
1304 the Printer object to close the connection before the client has sent all of the data (especially for the Print-  
1305 Job operation). A client MUST be prepared to keep submitting a create request until the IPP Printer object  
1306 accepts the create request. Issue 20

1307 At job processing time, since the Printer object has already responded with a successful status code in the  
1308 response to the create request, if the Printer object detects an error, the Printer object is unable to inform the  
1309 end user of the error with an operation status code. In this case, the Printer, depending on the error, can set  
1310 the job object's "job-state", "job-state-reasons", or "job-state-message" attributes to the appropriate value(s)  
1311 so that later queries can report the correct job status.

1312 Note: Asynchronous notification of events is outside the scope of ~~IPP/1.0~~ this IPP/1.1 document.

1313

## 1314 3.2 Printer Operations

1315 All Printer operations are directed at Printer objects. A client **MUST** always supply the "printer-uri"  
1316 operation attribute in order to identify the correct target of the operation.

## 1317 3.2.1 Print-Job Operation

1318 This **REQUIRED** operation allows a client to submit a print job with only one document and supply the  
1319 document data (rather than just a reference to the data). See Section 15 for the suggested steps for  
1320 processing create operations and their Operation and Job Template attributes.

## 1321 3.2.1.1 Print-Job Request

1322 The following groups of attributes are supplied as part of the Print-Job Request:

## 1323 Group 1: Operation Attributes

## 1324 Natural Language and Character Set:

1325 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.  
1326 The Printer object **MUST** copy these values to the corresponding Job Description attributes  
1327 described in sections 0 and 4.3.20.

1328

## 1329 Target:

1330 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1331 section 3.1.5.

1332

## 1333 Requesting User Name:

1334 The "requesting-user-name" (name(MAX)) attribute **SHOULD** be supplied by the client as  
1335 described in section 8.3.

1336

## 1337 "job-name" (name(MAX)):

1338 The client **OPTIONALLY** supplies this attribute. The Printer object **MUST** support this attribute. It  
1339 contains the client supplied Job name. If this attribute is supplied by the client, its value is used for  
1340 the "job-name" attribute of the newly created Job object. The client **MAY** automatically include any  
1341 information that will help the end-user distinguish amongst his/her jobs, such as the name of the  
1342 application program along with information from the document, such as the document name,  
1343 document subject, or source file name. If this attribute is not supplied by the client, the Printer  
1344 generates a name to use in the "job-name" attribute of the newly created Job object (see Section  
1345 4.3.5).

1346

## 1347 "ipp-attribute-fidelity" (boolean):

1348 The client **OPTIONALLY** supplies this attribute. The Printer object **MUST** support this attribute.  
1349 The value 'true' indicates that total fidelity to client supplied Job Template attributes and values is  
1350 required, else the Printer object **MUST** reject the Print-Job request. The value 'false' indicates that a  
1351 reasonable attempt to print the Job object is acceptable and the Printer object **MUST** accept the

1352 Print-job request. If not supplied, the Printer object assumes the value is 'false'. All Printer objects  
1353 MUST support both types of job processing. See section 15 for a full description of "ipp-attribute-  
1354 fidelity" and its relationship to other attributes, especially the Printer object's "pdl-override-  
1355 supported" attribute.  
1356

1357 "document-name" (name(MAX)):

1358 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.  
1359 It contains the client supplied document name. The document name MAY be different than the Job  
1360 name. Typically, the client software automatically supplies the document name on behalf of the end  
1361 user by using a file name or an application generated name. If this attribute is supplied, its value can  
1362 be used in a manner defined by each implementation. Examples include: printed along with the Job  
1363 (job start sheet, page adornments, etc.), used by accounting or resource tracking management tools,  
1364 or even stored along with the document as a document level attribute. ~~IPP/1.0~~IPP/1.1 does not  
1365 support the concept of document level attributes.  
1366

1367 "compression" (type3 keyword)

1368 The client OPTIONALLY supplies this attribute. The Printer object ~~OPTIONALLY~~  
1369 ~~supports~~MUST support this attribute and the "compression-supported" attribute (see section 4.4.32).  
1370 The client supplied "compression" operation attribute identifies the compression algorithm used on  
1371 the document data. The following cases exist:

- 1372 a) If the client omits this attribute, the Printer object MUST assume that the data is not  
1373 compressed: (i.e. the Printer follows the rules below as if the client supplied the  
1374 "compression" attribute with a value of 'none').
- 1375 b) ~~If the client supplies the attribute and the Printer object supports the attribute, the Printer~~  
1376 ~~object uses the corresponding decompression algorithm on the document data.~~ If the  
1377 client supplies this attribute, but the value is not supported by the Printer object, i.e., the  
1378 value is not one of the values of the Printer object's "compression-supported" attribute,  
1379 the Printer object MUST ~~copy the attribute and its value to the Unsupported Attributes~~  
1380 ~~response group,~~ reject the request, and return the ~~'client-error-attributes-or-values-not-~~  
1381 ~~supported' status code.~~'client-error-compression-not-supported' status code. See section  
1382 3.1.7 for returning unsupported attributes and values.
- 1383 c) If the client supplies the attribute and the Printer object supports the attribute value, the  
1384 Printer object uses the corresponding decompression algorithm on the document data.
- 1385 d) If the decompression algorithm fails before the Printer returns an operation response, the  
1386 Printer object MUST reject the request and return the 'client-error-compression-error'  
1387 status code.
- 1388 e) If the decompression algorithm fails after the Printer returns an operation response, the  
1389 Printer object MUST abort the job and add the 'compression-error' value to the job's  
1390 "job-state-reasons" attribute.
- 1391 f) If the decompression algorithm succeeds, the document data MUST then have the format  
1392 specified by the job's "document-format" attribute, if supplied (see "document-format"  
1393 operation attribute definition below). **Issue 28**  
1394

1395 "document-format" (mimeType) :

1396 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.  
1397 The value of this attribute identifies the format of the supplied document data. The following cases  
1398 exist:

- 1399 a) If the client does not supply this attribute, the Printer object assumes that the document  
1400 data is in the format defined by the Printer object's "document-format-default" attribute.  
1401 (i.e. the Printer follows the rules below as if the client supplied the "document-format"  
1402 attribute with a value equal to the printer's default value).
- 1403 b) If the client supplies this attribute, but the value is not supported by the Printer object,  
1404 i.e., the value is not one of the values of the Printer object's "document-format-  
1405 supported" attribute, the Printer object MUST reject the request and return the 'client-  
1406 error-document-format-not-supported' status code.
- 1407 c) If the client supplies this attribute and its value is 'application/octet-stream' (i.e. to be  
1408 auto-sensed, see Section 4.1.9.1), and the format is not one of the document-formats that  
1409 the Printer can auto-sense, and this check occurs before the Printer returns an operation  
1410 response, then the Printer MUST reject the request and return the 'client-error-  
1411 document-format-not-supported' status code.
- 1412 d) If the client supplies this attribute, and the value is supported by the Printer object, the  
1413 document data, the Printer is capable of interpreting the document data.
- 1414 e) If interpreting of the document data fails before the Printer returns an operation response,  
1415 the Printer object MUST reject the request and return the 'client-error-document-format-  
1416 error' status code.
- 1417 f) If interpreting of the document data fails after the Printer returns an operation response,  
1418 the Printer object MUST abort the job and add the 'document-format-error' value to the  
1419 job's "job-state-reasons" attribute. Issue 11

1420  
1421 "document-natural-language" (naturalLanguage):

1422 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1423 attribute. This attribute specifies the natural language of the document for those document-formats  
1424 that require a specification of the natural language in order to image the document unambiguously.  
1425 There are no particular values required for the Printer object to support.

1426  
1427  
1428 "job-k-octets" (integer(0:MAX))

1429 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1430 attribute and the "job-k-octets-supported" attribute (see section 4.4.33). The client supplied "job-k-  
1431 octets" operation attribute identifies the total size of the document(s) in K octets being submitted  
1432 (see section 4.3.17.1 for the complete semantics). If the client supplies the attribute and the Printer  
1433 object supports the attribute, the value of the attribute is used to populate the Job object's "job-k-  
1434 octets" Job Description attribute.

1435  
1436 ~~Note:~~ For this attribute and the following two attributes ("job-impressions", and "job-media-  
1437 sheets"), if the client supplies the attribute, but the Printer object does not support the attribute, the  
1438 Printer object ignores the client-supplied value. If the client supplies the attribute and the Printer  
1439 supports the attribute, and the value is within the range of the corresponding Printer object's "xxx-

1440 supported" attribute, the Printer object MUST use the value to populate the Job object's "xxx"  
1441 attribute. If the client supplies the attribute and the Printer supports the attribute, but the value is  
1442 outside the range of the corresponding Printer object's "xxx-supported" attribute, the Printer object  
1443 MUST copy the attribute and its value to the Unsupported Attributes response group, reject the  
1444 request, and return the 'client-error-attributes-or-values-not-supported' status code. If the client does  
1445 not supply the attribute, the Printer object MAY choose to populate the corresponding Job object  
1446 attribute depending on whether the Printer object supports the attribute and is able to calculate or  
1447 discern the correct value.

1448  
1449 "job-impressions" (integer(0:MAX))

1450 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1451 attribute and the "job-impressions-supported" attribute (see section 4.4.34). The client supplied  
1452 "job-impressions" operation attribute identifies the total size in number of impressions of the  
1453 document(s) being submitted (see section 4.3.17.2 for the complete semantics).

1454  
1455 See [note-last paragraph](#) under "job-k-octets".

1456  
1457 "job-media-sheets" (integer(0:MAX))

1458 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
1459 attribute and the "job-media-sheets-supported" attribute (see section 4.4.35). The client supplied  
1460 "job-media-sheets" operation attribute identifies the total number of media sheets to be produced for  
1461 this job (see section 4.3.17.3 for the complete semantics).

1462  
1463 See [note-last paragraph](#) under "job-k-octets".

1464  
1465 Group 2: Job Template Attributes

1466 The client OPTIONALLY supplies a set of Job Template attributes as defined in section 4.2. If the  
1467 client is not supplying any Job Template attributes in the request, the client SHOULD omit Group 2  
1468 rather than sending an empty group. However, a Printer object MUST be able to accept an empty  
1469 group.

1470  
1471 Group 3: Document Content

1472 The client MUST supply the document data to be processed.  
1473

1474 ~~Note~~-In addition to the MANDATORY parameters required for every operation request, the simplest Print-  
1475 Job Request consists of just the "attributes-charset" and "attributes-natural-language" operation attributes;  
1476 the "printer-uri" target operation attribute; the Document Content and nothing else. In this simple case, the  
1477 Printer object:

- 1478 - creates a new Job object (the Job object contains a single document),
- 1479 - stores a generated Job name in the "job-name" attribute in the natural language and charset requested  
1480 (see Section 3.1.4.1) (if those are supported, otherwise using the Printer object's default natural  
1481 language and charset), and

1482 - at job processing time, uses its corresponding default value attributes for the supported Job Template  
1483 attributes that were not supplied by the client as IPP attribute or embedded instructions in the  
1484 document data.  
1485

### 1486 3.2.1.2 Print-Job Response

1487 The Printer object MUST return to the client the following sets of attributes as part of the Print-Job  
1488 Response:

#### 1489 Group 1: Operation Attributes

##### 1490 Status Message:

1491 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1492 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6. If  
1493 the client supplies unsupported or conflicting Job Template attributes or values, the Printer object  
1494 MUST reject or accept the Print-Job request depending on the whether the client supplied a 'true' or  
1495 'false' value for the "ipp-attribute-fidelity" operation attribute. See the Implementer's Guide [IPP-  
1496 IIG] for a complete description of the suggested steps for processing a create request.  
1497

##### 1498 Natural Language and Character Set:

1499 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
1500

#### 1501 Group 2: Unsupported Attributes

1502 ~~This is a set of Operation and Job Template attributes supplied by the client (in the request) that are~~  
1503 ~~not supported by the Printer object or that conflict with one another (see the Implementer's Guide~~  
1504 ~~[IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the response, the~~  
1505 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
1506 ~~MUST be able to accept an empty group.~~

##### 1507 ~~Unsupported attributes fall into three categories:~~

- 1508 ~~1. The Printer object does not support the supplied attribute (no matter what the attribute syntax or~~  
1509 ~~value).~~
- 1510 ~~2. The Printer object does support the attribute, but does not support some or all of the particular~~  
1511 ~~attribute syntaxes or values supplied by the client (i.e., the Printer object does not have those~~  
1512 ~~attribute syntaxes or values in its corresponding "xxx-supported" attribute).~~
- 1513 ~~3. The Printer object does support the attributes and values supplied, but the particular values are in~~  
1514 ~~conflict with one another, because they violate a constraint, such as not being able to staple~~  
1515 ~~transparencies.~~

1516 ~~In the case of an unsupported attribute name, the Printer object returns the client-supplied attribute~~  
1517 ~~with a substituted "out-of-band" value of 'unsupported' indicating no support for the attribute itself~~  
1518 ~~(see the beginning of section 4.1).~~  
1519  
1520  
1521  
1522

1523 ~~In the case of a supported attribute with one or more unsupported attribute syntaxes or values, the~~  
1524 ~~Printer object simply returns the client-supplied attribute with the unsupported attribute syntaxes or~~  
1525 ~~values as supplied by the client. This indicates support for the attribute, but no support for that~~  
1526 ~~particular attribute syntax or value. If the client supplies a multi-valued attribute with more than~~  
1527 ~~one value and the Printer object supports the attribute but only supports a subset of the client-~~  
1528 ~~supplied attribute syntaxes or values, the Printer object MUST return only those attribute syntaxes~~  
1529 ~~or values that are unsupported.~~

1530  
1531 ~~In the case of two (or more) supported attribute values that are in conflict with one another~~  
1532 ~~(although each is supported independently, the values conflict when requested together within the~~  
1533 ~~same job), the Printer object MUST return all the values that it ignores or substitutes to resolve the~~  
1534 ~~conflict, but not any of the values that it is still using. The choice for exactly how to resolve the~~  
1535 ~~conflict is implementation dependent. See The Implementer's Guide [IPP-IG] for an example.~~

1536  
1537  
1538 See section 3.1.7 for details on returning Unsupported Attributes.

1539  
1540 ~~In these three cases, the~~The value of the "ipp-attribute-fidelity" supplied by the client does not affect  
1541 what attributes the Printer object returns in this group. The value of "ipp-attribute-fidelity" only  
1542 affects whether the Print-Job operation is accepted or rejected. If the job is accepted, the client may  
1543 query the job using the Get-Job-Attributes operation requesting the unsupported attributes that were  
1544 returned in the create response to see which attributes were ignored (not stored on the Job object)  
1545 and which attributes were stored with other (substituted) values.

1546

### 1547 Group 3: Job Object Attributes

1548 "job-uri" (uri):

1549 The Printer object MUST return the Job object's URI by returning the contents of the REQUIRED  
1550 "job-uri" Job object attribute. The client uses the Job object's URI when directing operations at the  
1551 Job object. The Printer object always uses its configured security policy when creating the new  
1552 URI. However, if the Printer object supports more than one URI, the Printer object also uses  
1553 information about which URI was used in the Print-Job Request to generate the new URI so that  
1554 the new URI references the correct access channel. In other words, if the Print-Job Request comes  
1555 in over a secure channel, the Printer object MUST generate a Job URI that uses the secure channel  
1556 as well.

1557

1558 "job-id" (integer(1:MAX)):

1559 The Printer object MUST return the Job object's Job ID by returning the REQUIRED "job-id" Job  
1560 object attribute. The client uses this "job-id" attribute in conjunction with the "printer-uri" attribute  
1561 used in the Print-Job Request when directing Job operations at the Printer object.

1562

1563 "job-state":

1564 The Printer object MUST return the Job object's REQUIRED "job-state" attribute. The value of this  
1565 attribute (along with the value of the next attribute: "job-state-reasons") is taken from a "snapshot"

1566 of the new Job object at some meaningful point in time (implementation defined) between when the  
1567 Printer object receives the Print-Job Request and when the Printer object returns the response.

1568  
1569 "job-state-reasons":

1570 The Printer object ~~OPTIONALLY returns~~**MUST return** the Job object's ~~OPTIONAL "job-state-~~  
1571 ~~reasons" attribute. If the Printer object supports this attribute then it MUST be returned in the~~  
1572 ~~response. If this attribute is not returned in the response, the client can assume that the "job-state-~~  
1573 ~~reasons" attribute is not supported and will not~~**REQUIRED "job-state-reasons" attribute.** . **Issue 30**  
1574 ~~be returned in a subsequent Job object query.~~

1575  
1576 "job-state-message":

1577 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "job-state-message"  
1578 attribute. If the Printer object supports this attribute then it **MUST** be returned in the response. If  
1579 this attribute is not returned in the response, the client can assume that the "job-state-message"  
1580 attribute is not supported and will not be returned in a subsequent Job object query.

1581  
1582 "number-of-intervening-jobs":

1583 The Printer object **OPTIONALLY** returns the Job object's **OPTIONAL** "number-of-intervening-  
1584 jobs" attribute. If the Printer object supports this attribute then it **MUST** be returned in the response.  
1585 If this attribute is not returned in the response, the client can assume that the "number-of-  
1586 intervening-jobs" attribute is not supported and will not be returned in a subsequent Job object  
1587 query.

1588  
1589 Note: Since any printer state information which affects a job's state is reflected in the "job-state" and  
1590 "job-state-reasons" attributes, it is sufficient to return only these attributes and no specific printer  
1591 status attributes.

1592

1593 Note: In addition to the **MANDATORY** parameters required for every operation response, the simplest  
1594 response consists of the just the "attributes-charset" and "attributes-natural-language" operation attributes  
1595 and the "job-uri", "job-id", and "job-state" Job Object Attributes. In this simplest case, the status code is  
1596 ~~"successful-ok"~~**'successful-ok'** and there is no "status-message" operation attribute.

### 1597 3.2.2 Print-URI Operation

1598 This **OPTIONAL** operation is identical to the Print-Job operation (section 3.2.1) except that a client  
1599 supplies a URI reference to the document data using the "document-uri" (uri) operation attribute (in Group  
1600 1) rather than including the document data itself. Before returning the response, the Printer **MUST** validate  
1601 that the Printer supports the retrieval method (e.g., http, ftp, etc.) implied by the URI, and **MUST** check for  
1602 valid URI syntax. If the client-supplied URI scheme is not supported, i.e. the value is not in the Printer  
1603 object's "referenced-uri-scheme-supported" attribute, the Printer object **MUST** reject the request and return  
1604 the 'client-error-uri-scheme-not-supported' status code.

1605 The IPP Printer MAY validate the accessibility of the document as part of the operation or subsequently. If  
1606 the Printer determines an accessibility problem before returning an operation response, it rejects the request  
1607 and returns the 'client-error-document-access-error' status code. The Printer MAY also return a specific

1608 document access error code using the "document-access-error" operation attribute (see section 3.1.6.4).  
1609 Issue 35

1610 If the Printer determines this document accessibility problem after accepting the request and returning an  
1611 operation response with one of the successful status codes, the Printer adds the 'document-access-error'  
1612 value to the job's "job-state-reasons" attribute and MAY populate the job's "job-document-access-errors"  
1613 Job Description attribute (see section 4.3.11). See The Implementer's Guide [IPP-IIG] for suggested  
1614 additional checks. ~~The Printer NEED NOT follow the reference and validate the contents of the~~  
1615 ~~reference.~~ Issue 35

1616 If the Printer object supports this operation, it MUST support the "reference-uri-schemes-supported" Printer  
1617 attribute (see section 4.4.27).

1618 It is up to the IPP object to interpret the URI and subsequently "pull" the document from the source  
1619 referenced by the URI string.

### 1620 3.2.3 Validate-Job Operation

1621 This REQUIRED operation is similar to the Print-Job operation (section 3.2.1) except that a client supplies  
1622 no document data and the Printer allocates no resources (i.e., it does not create a new Job object). This  
1623 operation is used only to verify capabilities of a printer object against whatever attributes are supplied by  
1624 the client in the Validate-Job request. By using the Validate-Job operation a client can validate that an  
1625 identical Print-Job operation (with the document data) would be accepted. The Validate-Job operation also  
1626 performs the same security negotiation as the Print-Job operation (see section 8), so that a client can check  
1627 that the client and Printer object security requirements can be met before performing a Print-Job operation.

1628 ~~Note-~~The Validate-Job operation does not accept a "document-uri" attribute in order to allow a client to  
1629 check that the same Print-URI operation will be accepted, since the client doesn't send the data with the  
1630 Print-URI operation. The client SHOULD just issue the Print-URI request.

1631 The Printer object returns the same status codes, Operation Attributes (Group 1) and Unsupported  
1632 Attributes (Group 2) as the Print-Job operation. However, no Job Object Attributes (Group 3) are returned,  
1633 since no Job object is created.

### 1634 3.2.4 Create-Job Operation

1635 This OPTIONAL operation is similar to the Print-Job operation (section 3.2.1) except that in the Create-Job  
1636 request, a client does not supply document data or any reference to document data. Also, the client does not  
1637 supply any of the "document-name", "document-format", "compression", or "document-natural-language"  
1638 operation attributes. This operation is followed by one or more Send-Document or Send-URI operations.  
1639 In each of those operation requests, the client OPTIONALLY supplies the "document-name", "document-  
1640 format", and "document-natural-language" attributes for each document in the multi-document Job object.

1641 If a Printer object supports the Create-Job operation, it MUST also support the Send-Document operation  
1642 and also MAY support the Send-URI operation.

1643 If the Printer object supports this operation, it MUST support the "multiple-operation-time-out" Printer  
1644 attribute (see section 4.4.31).

1645 ~~In addition to the Print-Job status codes in the following additional error status codes not applicable to~~  
1646 ~~Print-Job MAY be returned:~~

1647 If the Printer object supports this operation, then it MUST support the "multiple-document-jobs-supported"  
1648 Printer Description attribute (see section 4.4.16) and indicate whether or not it supports multiple-document  
1649 jobs. Issue 34

1650 If the Printer object supports this operation and supports multiple documents in a job, then it MUST support  
1651 the "multiple-document-handling" Job Template job attribute with at least one value (see section 4.2.4) and  
1652 the associated "multiple-document-handling-default" and "multiple-document-handling-supported" Job  
1653 Template Printer attributes (see section 4.2). Issue 34

1654 After the Create-Job operation has completed, the value of the "job-state" attribute is similar to the "job-  
1655 state" after a Print-Job, even though no document-data has arrived. A Printer MAY set the 'job-data-  
1656 insufficient' value of the job's "job-state-reason" attribute to indicate that processing cannot begin until  
1657 sufficient data has arrived and set the "job-state" to either 'pending' or 'pending-held'. A non-spooling  
1658 printer that doesn't implement the 'pending' job state may even set the "job-state" to 'processing', even  
1659 though there is not yet any data to process. See sections 4.3.7 and 4.3.8. Issue 13

### 1660 3.2.5 Get-Printer-Attributes Operation

1661 This REQUIRED operation allows a client to request the values of the attributes of a Printer object. In the  
1662 request, the client supplies the set of Printer attribute names and/or attribute group names in which the  
1663 requester is interested. In the response, the Printer object returns a corresponding attribute set with the  
1664 appropriate attribute values filled in.

1665 For Printer objects, the possible names of attribute groups are:

- 1666 - 'job-template': ~~all~~ the subset of the Job Template attributes that apply to a Printer object (the last two  
1667 columns of the table in Section 4.2) that the implementation supports for Printer objects.
- 1668 - 'printer-description': the subset of the attributes specified in Section 4.4 that the implementation  
1669 supports for Printer objects.
- 1670 - 'all': the special group 'all' that includes all ~~supported attributes~~ attributes that the implementation  
1671 supports for Printer objects. Issue 23

1672  
1673 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
1674 overlap. For example, if a client requests, 'printer-name' and 'all', the client is actually requesting the  
1675 "printer-name" attribute twice: once by naming it explicitly, and once by inclusion in the 'all' group. In such  
1676 cases, the Printer object NEED NOT return each attribute only once in the response even if it is requested  
1677 multiple times. The client SHOULD NOT request the same attribute in multiple ways.

1678 It is NOT REQUIRED that a Printer object support all attributes belonging to a group (since some attributes  
1679 are OPTIONAL). However, it is REQUIRED that each Printer object support all group names.

## 1680 3.2.5.1 Get-Printer-Attributes Request

1681 The following sets of attributes are part of the Get-Printer-Attributes Request:

## 1682 Group 1: Operation Attributes

## 1683 Natural Language and Character Set:

1684 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1685

## 1686 Target:

1687 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1688 section 3.1.5.

1689

## 1690 Requesting User Name:

1691 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
1692 described in section 8.3.

1693

## 1694 "requested-attributes" (1setOf keyword) :

1695 The client OPTIONALLY supplies a set of attribute names and/or attribute group names in whose  
1696 values the requester is interested. The Printer object MUST support this attribute. If the client  
1697 omits this attribute, the Printer MUST respond as if this attribute had been supplied with a value of  
1698 'all'.

1699

## 1700 "document-format" (mimeMediaType) :

1701 The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute.  
1702 This attribute is useful for a Printer object to determine the set of supported attribute values that  
1703 relate to the requested document format. The Printer object MUST return the attributes and values  
1704 that it uses to validate a job on a create or Validate-Job operation in which this document format is  
1705 supplied. The Printer object SHOULD return only (1) those attributes that are supported for the  
1706 specified format and (2) the attribute values that are supported for the specified document format.  
1707 By specifying the document format, the client can get the Printer object to eliminate the attributes  
1708 and values that are not supported for a specific document format. For example, a Printer object  
1709 might have multiple interpreters to support both 'application/postscript' (for PostScript) and  
1710 'text/plain' (for text) documents. However, for only one of those interpreters might the Printer  
1711 object be able to support "number-up" with values of '1', '2', and '4'. For the other interpreter it  
1712 might be able to only support "number-up" with a value of '1'. Thus a client can use the Get-Printer-  
1713 Attributes operation to obtain the attributes and values that will be used to accept/reject a create job  
1714 operation.

1715

1716 If the Printer object does not distinguish between different sets of supported values for each  
1717 different document format when validating jobs in the create and Validate-Job operations, it MUST  
1718 NOT distinguish between different document formats in the Get-Printer-Attributes operation. If the  
1719 Printer object does distinguish between different sets of supported values for each different  
1720 document format specified by the client, this specialization applies only to the following Printer  
1721 object attributes:

1722

- 1723 - Printer attributes that are Job Template attributes ("xxx-default" "xxx-supported", and "xxx-  
1724 ready" in the Table in Section 4.2),  
1725 - "pdl-override-supported",  
1726 - "compression-supported",  
1727 - "job-k-octets-supported",  
1728 - "job-impressions-supported",  
1729 - "job-media-sheets-supported"  
1730 - "printer-driver-installer",  
1731 - "color-supported", and  
1732 - "reference-uri-schemes-supported"  
1733

1734 The values of all other Printer object attributes (including "document-format-supported") remain  
1735 invariant with respect to the client supplied document format (except for new Printer description  
1736 attribute as registered according to section 6.2).  
1737

1738 If the client omits this "document-format" operation attribute, the Printer object MUST respond as if  
1739 the attribute had been supplied with the value of the Printer object's "document-format-default"  
1740 attribute. It is recommended that the client always supply a value for "document-format", since the  
1741 Printer object's "document-format-default" may be 'application/octet-stream', in which case the  
1742 returned attributes and values are for the union of the document formats that the Printer can  
1743 automatically sense. For more details, see the description of the 'mimeType' attribute syntax  
1744 in section 4.1.9.  
1745

1746 If the client supplies a value for the "document-format" Operation attribute that is not supported by  
1747 the Printer, i.e., is not among the values of the Printer object's "document-format-supported"  
1748 attribute, the Printer object MUST reject the operation and return the 'client-error-document-format-  
1749 not-supported' status code.  
1750

### 1751 3.2.5.2 Get-Printer-Attributes Response

1752 The Printer object returns the following sets of attributes as part of the Get-Printer-Attributes Response:

#### 1753 Group 1: Operation Attributes

##### 1754 Status Message:

1755 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1756 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.  
1757

##### 1758 Natural Language and Character Set:

1759 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
1760

#### 1761 Group 2: Unsupported Attributes

1762 [See section 3.1.7 for details on returning Unsupported Attributes.](#)  
1763

1764 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
1765 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and 16).~~ The response  
1766 NEED NOT contain the "requested-attributes" operation attribute with any supplied values (attribute  
1767 keywords) that were requested by the client but are not supported by the IPP object. If the Printer  
1768 object ~~is not returning any Unsupported Attributes in the response, the Printer object SHOULD omit~~  
1769 ~~Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty~~  
1770 ~~group.~~  
1771 does include unsupported attributes referenced in "requested-attributes" and such attributes include  
1772 group names, such as 'all', the unsupported attributes MUST NOT include attributes described in the  
1773 standard but not supported by the implementation. Issue 23  
1774

### 1775 Group 3: Printer Object Attributes

1776 This is the set of requested attributes and their current values. The Printer object ignores (does not  
1777 respond with) any requested attribute which is not supported. The Printer object MAY respond with  
1778 a subset of the supported attributes and values, depending on the security policy in force. However,  
1779 the Printer object MUST respond with the 'unknown' value for any supported attribute (including all  
1780 REQUIRED attributes) for which the Printer object does not know the value. Also the Printer  
1781 object MUST respond with the 'no-value' for any supported attribute (including all REQUIRED  
1782 attributes) for which the system administrator has not configured a value. See the description of the  
1783 "out-of-band" values in the beginning of Section 4.1.  
1784

### 1785 3.2.6 Get-Jobs Operation

1786 This REQUIRED operation allows a client to retrieve the list of Job objects belonging to the target Printer  
1787 object. The client may also supply a list of Job attribute names and/or attribute group names. A group of  
1788 Job object attributes will be returned for each Job object that is returned.

1789 This operation is similar to the Get-Job-Attributes operation, except that this Get-Jobs operation returns  
1790 attributes from possibly more than one object (see the description of Job attribute group names in section  
1791 3.3.4).

#### 1792 3.2.6.1 Get-Jobs Request

1793 The client submits the Get-Jobs request to a Printer object.

1794 The following groups of attributes are part of the Get-Jobs Request:

#### 1795 Group 1: Operation Attributes

1796 Natural Language and Character Set:

1797 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

1798

1799 Target:

1800 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
1801 section 3.1.5.

1802

1803

Requesting User Name:

1804

The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as described in section 8.3.

1805

1806

1807

"limit" (integer(1:MAX)):

1808

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It is an integer value that ~~indicates a limit to the number of Job objects~~determines the maximum number of jobs that a client will receive from the Printer even if "which-jobs" or "my-jobs" constrain which jobs are returned. The limit is a "stateless limit" in that if the value supplied by the client is 'N', then only the first 'N' jobs are returned in the Get-Jobs Response. There is no mechanism to allow for the next 'M' jobs after the first 'N' jobs. If the client does not supply this attribute, the Printer object responds with all applicable jobs. **Issue 8**

1809

1810

1811

1812

1813

1814

1815

1816

"requested-attributes" (1setOf keyword):

1817

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It is a set of Job attribute names and/or attribute groups names in whose values the requester is interested. This set of attributes is returned for each Job object that is returned. The allowed attribute group names are the same as those defined in the Get-Job-Attributes operation in section 3.3.4. If the client does not supply this attribute, the Printer MUST respond as if the client had supplied this attribute with two values: 'job-uri' and 'job-id'.

1818

1819

1820

1821

1822

1823

1824

"which-jobs" (keyword):

1825

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It indicates which Job objects MUST be returned by the Printer object. The values for this attribute are:

1826

1827

1828

1829

'completed': This includes any Job object whose state is 'completed', 'canceled', or 'aborted'.

1830

'not-completed': This includes any Job object whose state is 'pending', 'processing', 'processing-stopped', or 'pending-held'.

1831

1832

1833

A Printer object MUST support both values. However, if the implementation does not keep jobs in the 'completed', 'canceled', and 'aborted' states, then it returns no jobs when the 'completed' value is supplied.

1834

1835

1836

1837

If a client supplies some other value, the Printer object MUST copy the attribute and the unsupported value to the Unsupported Attributes response group, reject the request, and return the 'client-error-attributes-or-values-not-supported' status code.

1838

1839

1840

1841

If the client does not supply this attribute, the Printer object MUST respond as if the client had supplied the attribute with a value of 'not-completed'.

1842

1843

1844

"my-jobs" (boolean):

1845

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It indicates whether~~all~~ jobs from all users or just the jobs submitted by the requesting user of this

1846

1847 request MUST be returned by the Printer object. If the client does not supply this attribute, the  
1848 Printer object MUST respond as if the client had supplied the attribute with a value of 'false', i.e., ~~all~~  
1849 ~~jobs:~~jobs from all users. The means for authenticating the requesting user and matching the jobs is  
1850 described in section 8.

### 1851 3.2.6.2 Get-Jobs Response

1852 The Printer object returns all of the Job objects up to the number specified by the "limit" attribute that  
1853 match the criteria as defined by the attribute values supplied by the client in the request. It is possible that  
1854 no Job objects are returned since there may literally be no Job objects at the Printer, or there may be no Job  
1855 objects that match the criteria supplied by the client. If the client requests any Job attributes at all, there is a  
1856 set of Job Object Attributes returned for each Job object.

1857 It is not an error for the Printer to return 0 jobs. If the response returns 0 jobs because there are no jobs  
1858 matching the criteria, and the request would have returned 1 or more jobs with a status code of 'successful-  
1859 ok' if there had been jobs matching the criteria, then the status code for 0 jobs MUST be 'successful-ok'.  
1860 **Issue 24**

#### 1861 Group 1: Operation Attributes

##### 1862 Status Message:

1863 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
1864 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

##### 1866 Natural Language and Character Set:

1867 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

#### 1869 Group 2: Unsupported Attributes

1870 See section 3.1.7 for details on returning Unsupported Attributes.

1871  
1872 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
1873 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
1874 ~~[IPP-IG]). The response NEED NOT contain the "requested-attributes" operation attribute with~~  
1875 ~~any supplied values (attribute keywords) that were requested by the client but are not supported by~~  
1876 ~~the IPP object. If the Printer object is not returning any Unsupported Attributes in the response, the~~  
1877 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
1878 ~~MUST be able to accept an empty group.~~

1879 does include unsupported attributes referenced in "requested-attributes" and such attributes include  
1880 group names, such as 'all', the unsupported attributes MUST NOT include attributes described in the  
1881 standard but not supported by the implementation. Issue 23

#### 1883 Groups 3 to N: Job Object Attributes

1884 The Printer object responds with one set of Job Object Attributes for each returned Job object. The  
1885 Printer object ignores (does not respond with) any requested attribute or value which is not  
1886 supported or which is restricted by the security policy in force, including whether the requesting

1887 user is the user that submitted the job (job originating user) or not (see section 8). However, the  
1888 Printer object MUST respond with the 'unknown' value for any supported attribute (including all  
1889 REQUIRED attributes) for which the Printer object does not know the value, unless it would violate  
1890 the security policy. See the description of the "out-of-band" values in the beginning of Section 4.1.  
1891

1892 Jobs are returned in the following order:

- 1893 - If the client requests all 'completed' Jobs (Jobs in the 'completed', 'aborted', or 'canceled' states),  
1894 then the Jobs are returned newest to oldest (with respect to actual completion time)
- 1895 - If the client requests all 'not-completed' Jobs (Jobs in the 'pending', 'processing', 'pending-held',  
1896 and 'processing-stopped' states), then Jobs are returned in relative chronological order of  
1897 expected time to complete (based on whatever scheduling algorithm is configured for the  
1898 Printer object).

### 1899 3.2.7 Pause-Printer Operation

1900 This OPTIONAL operation allows a client to stop the Printer object from scheduling jobs on all its devices.  
1901 Depending on implementation, the Pause-Printer operation MAY also stop the Printer from processing the  
1902 current job or jobs. Any job that is currently being printed is either stopped as soon as the implementation  
1903 permits or is completed, depending on implementation. The Printer object MUST still accept create  
1904 operations to create new jobs, but MUST prevent any jobs from entering the 'processing' state.

1905 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
1906 vice-versa.

1907 The IPP Printer stops the current job(s) on its device(s) that were in the 'processing' or 'processing-stopped'  
1908 states as soon as the implementation permits. If the implementation Issue 30 will take appreciable time to  
1909 stop, the IPP Printer adds the 'moving-to-paused' value to the Printer object's "printer-state-reasons"  
1910 attribute (see section 4.4.12). When the device(s) have all stopped, the IPP Printer transitions the Printer  
1911 object to the 'stopped' state, removes the 'moving-to-paused' value, if present, and adds the 'paused' value to  
1912 the Printer object's "printer-state-reasons" attribute.

1913 When the current job(s) complete that were in the 'processing' state, the IPP Printer transitions them to the  
1914 'completed' state. When the current job(s) stop in mid processing that were in the 'processing' state, the IPP  
1915 Printer transitions them to the 'processing-stopped' state and Issue 30 adds the 'printer-stopped' value to the  
1916 job's "job-state-reasons" attribute.

1917 For any jobs that are 'pending' or 'pending-held', the 'printer-stopped' value of the jobs' "job-state-reasons"  
1918 attribute also applies. However, the IPP Printer NEED NOT update those jobs' "job-state-reasons"  
1919 attributes and only need return the 'printer-stopped' value when those jobs are queried (so-called "lazy  
1920 evaluation").

1921 Whether the Pause-Printer operation affects jobs that were submitted to the device from other sources than  
1922 the IPP Printer object in the same way that the Pause-Printer operation affects jobs that were submitted to  
1923 the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol is being used  
1924 as a universal management protocol or just to manage IPP jobs, respectively.

1925 The IPP Printer MUST accept the request in any state and transition the Printer to the indicated new  
 1926 "printer-state" before returning as follows:

<u>Current</u> <u>"printer-state"</u>	<u>New</u> <u>"printer-state"</u>	<u>"printer-</u> <u>state-</u> <u>reasons"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'moving-to-</u> <u>paused'</u>	<u>OPTION 1: 'successful-ok';</u> <u>Later, when all output has stopped, the "printer-</u> <u>state" becomes 'stopped', and the 'paused' value</u> <u>replaces the 'moving-to-paused' value in the</u> <u>"printer-state-reasons" attribute</u>
<u>'processing'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>OPTION 2: 'successful-ok';</u> <u>all device output stopped immediately</u>
<u>'stopped'</u>	<u>'stopped'</u>	<u>'paused'</u>	<u>'successful-ok'</u>

1927 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
 1928 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
 1929 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'  
 1930 as appropriate.

### 1931 3.2.7.1 Pause-Printer Request

1932 The following groups of attributes are part of the Pause-Printer Request:

#### 1933 Group 1: Operation Attributes

##### 1934 Natural Language and Character Set:

1935 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

##### 1936 Target:

1937 The "printer-uri" (uri) operation attribute which is the target for this operation as described in  
 1938 section 3.1.5.

##### 1939 Requesting User Name:

1940 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
 1941 described in section 8.3.

### 1942 3.2.7.2 Pause-Printer Response

1943 The following groups of attributes are part of the Pause-Printer Response:

#### 1944 Group 1: Operation Attributes

##### 1945 Status Message:

1946 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
 1947 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

1950

1951 Natural Language and Character Set:  
 1952 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
 1953

1954 Group 2: Unsupported Attributes

1955 See section 3.1.7 for details on returning Unsupported Attributes.  
 1956

1957 3.2.8 Resume-Printer Operation

1958 This operation allows a client to resume the Printer object scheduling jobs on all its devices. The Printer  
 1959 object **Issue 30** MUST remove the 'paused' and 'moving-to-paused' values from the Printer object's  
 1960 "printer-state-reasons" attribute, if present. If there are no other reasons to keep a device paused (such as  
 1961 media-jam), the IPP Printer transitions itself to the 'processing' or 'idle' states, depending on whether there  
 1962 are jobs to be processed or not, respectively, and the device(s) resume processing jobs.

1963 If the Pause-Printer operation is supported, then the Resume-Printer operation MUST be supported, and  
 1964 vice-versa.

1965 The IPP Printer removes the 'printer-stopped' value from any job's "job-state-reasons" attributes contained  
 1966 in that Printer.

1967 The IPP Printer MUST accept the request in any state, transition the Printer object to the indicated new state  
 1968 as follows:

<u>Current "printer-state"</u>	<u>New "printer-state"</u>	<u>IPP Printer's response status code and action:</u>
<u>'idle'</u>	<u>'idle'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok'</u>
<u>'stopped'</u>	<u>'processing'</u>	<u>'successful-ok';</u> <u>when there are jobs to be processed</u>
<u>'stopped'</u>	<u>'idle'</u>	<u>'successful-ok';</u> <u>when there are no jobs to be processed.</u>

1969 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
 1970 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP Printer MUST reject the  
 1971 operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized'  
 1972 as appropriate.

1973 The Resume-Printer Request and Resume-Printer Response have the same attribute groups and attributes as  
 1974 the Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1975 3.2.9 Purge-Jobs Operation

1976 This OPTIONAL operation allows a client to remove all jobs from an IPP Printer object, regardless of their  
 1977 job states, including jobs in the Printer object's Job History (see Section 4.3.7.2). After a Purge-Jobs

1978 operation has been performed, a Printer object MUST return no jobs in subsequent Get-Job-Attributes and  
1979 Get-Jobs responses (until new jobs are submitted).

1980 Whether the Purge-Jobs (and Get-Jobs) operation affects jobs that were submitted to the device from other  
1981 sources than the IPP Printer object in the same way that the Purge-Jobs operation affects jobs that were  
1982 submitted to the IPP Printer object using IPP, depends on implementation, i.e., on whether the IPP protocol  
1983 is being used as a universal management protocol or just to manage IPP jobs, respectively.

1984 Note: if an operator wants to cancel all jobs without clearing out the Job History, the operator uses the  
1985 Cancel-Job operation on each job instead of using the Purge-Job operation.

1986 The Printer object MUST accept this operation in any state and transition the Printer object to the 'idle'  
1987 state.

1988 Access Rights: The authenticated user (see section 8.3) performing this operation must be an operator or  
1989 administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP object MUST reject the  
1990 operation and return: client-error-forbidden, client-error-not-authenticated, and client-error-not-authorized  
1991 as appropriate.

1992 The Purge-Jobs Request and Purge-Jobs Response have the same attribute groups and attributes as the  
1993 Pause-Printer operation (see sections 3.2.7.1 and 3.2.7.2).

1994

### 1995 3.3 Job Operations

1996 All Job operations are directed at Job objects. A client MUST always supply some means of identifying the  
1997 Job object in order to identify the correct target of the operation. That job identification MAY either be a  
1998 single Job URI or a combination of a Printer URI with a Job ID. The IPP object implementation MUST  
1999 support both forms of identification for every job.

#### 2000 3.3.1 Send-Document Operation

2001 This OPTIONAL operation allows a client to create a multi-document Job object that is initially "empty"  
2002 (contains no documents). In the Create-Job response, the Printer object returns the Job object's URI (the  
2003 "job-uri" attribute) and the Job object's 32-bit identifier (the "job-id" attribute). For each new document  
2004 that the client desires to add, the client uses a Send-Document operation. Each Send-Document Request  
2005 contains the entire stream of document data for one document.

2006 If the Printer supports this operation but does not support multiple documents per job, the Printer MUST  
2007 reject subsequent Send-Document operations supplied with data and return the 'server-error-multiple-  
2008 document-jobs-not-supported'. However, the Printer MUST accept the first document with a 'true' or 'false'  
2009 value for the "last-document" operation attribute (see below), so that clients MAY always submit one  
2010 document jobs with a 'false' value for "last-document" in the first Send-Document and a 'true' for "last-  
2011 document" in the second Send-Document (with no data). Issue 34

2012 Since the Create-Job and the send operations (Send-Document or Send-URI operations) that follow could  
2013 occur over an arbitrarily long period of time for a particular job, a client MUST send another send operation

2014 within an IPP Printer defined minimum time interval after the receipt of the previous request for the job. If  
2015 a Printer object supports multiple document jobs, the Printer object MUST support the "multiple-operation-  
2016 time-out" attribute (see section 4.4.31). This attribute indicates the minimum number of seconds the Printer  
2017 object will wait for the next send operation before taking some recovery action.

2018 An IPP object MUST recover from an errant client that does not supply a send operation, sometime after  
2019 the minimum time interval specified by the Printer object's "multiple-operation-time-out" attribute. Such  
2020 recovery MAY include any of the following or other recovery actions:

- 2021 1. Assume that the Job is an invalid job, start the process of changing the job state to 'aborted', add the  
2022 'aborted-by-system' value to the job's "job-state-reasons" attribute (see section 4.3.8), ~~if~~  
2023 ~~supported~~, **Issue 30** and clean up all resources associated with the Job. In this case, if another send  
2024 operation is finally received, the Printer responds with a "client-error-not-possible" or "client-error-  
2025 not-found" depending on whether or not the Job object is still around when the send operation  
2026 finally arrives.
- 2027 2. Assume that the last send operation received was in fact the last document (as if the "last-document"  
2028 flag had been set to 'true'), close the Job object, and proceed to process it (i.e., move the Job's state  
2029 to 'pending').
- 2030 3. Assume that the last send operation received was in fact the last document, close the Job, but move it  
2031 to the 'pending-held' and add the 'submission-interrupted' value to the job's "job-state-reasons"  
2032 attribute (see section ~~4.3.8~~, ~~if supported~~, ~~4.3.8~~). **Issue 30** This action allows the user or an  
2033 operator to determine whether to continue processing the Job by moving it back to the 'pending'  
2034 state using the Release-Job operation (see section 3.3.6) or to cancel the job using the Cancel-Job  
2035 operation (see section 3.3.3).

2037 Each implementation is free to decide the "best" action to take depending on local policy, whether any  
2038 documents have been added, whether the implementation spools jobs or not, and/or any other piece of  
2039 information available to it. If the choice is to abort the Job object, it is possible that the Job object may  
2040 already have been processed to the point that some media sheet pages have been printed.

2041 *Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job*  
2042 *owner (as determined in the Create-Job operation) or an operator or administrator of the Printer object (see*  
2043 *Sections 1 and 8.5). Otherwise, the IPP object MUST reject the operation and return: 'client-error-*  
2044 *forbidden', 'client-error-not-authenticated', or 'client-error-not-authorized' as appropriate.* **Issue 19**

#### 2045 3.3.1.1 Send-Document Request

2046 The following attribute sets are part of the Send-Document Request:

##### 2047 Group 1: Operation Attributes

2048 Natural Language and Character Set:

2049 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2050

2051  
2052  
2053  
2054  
2055  
2056  
2057  
2058  
2059  
2060  
2061  
2062  
2063  
2064  
2065  
2066  
2067  
2068  
2069  
2070  
2071  
2072  
2073  
2074

2089  
2090  
2091  
2092  
2093  
2094  
2095

Target:

Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation attribute(s) which define the target for this operation as described in section 3.1.5.

Requesting User Name:

The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as described in section 8.3.

"document-name" (name(MAX)):

The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. It contains the client supplied document name. The document name MAY be different than the Job name. It might be helpful, but NEED NOT be unique across multiple documents in the same Job. Typically, the client software automatically supplies the document name on behalf of the end user by using a file name or an application generated name. See the description of the "document-name" operation attribute in the Print-Job Request (section 3.2.1.1) for more information about this attribute.

"compression" (type3 keyword)

See the description of "compression" for the Print-Job operation in Section 3.2.1.1.

"document-format" (mimeMediaType) :

~~The client OPTIONALLY supplies this attribute. The Printer object MUST support this attribute. The value of this attribute identifies the format of the supplied document data. If the client does not supply this attribute, the Printer object assumes that the document data is in the format defined by the Printer object's "document-format-default" attribute. If the client supplies this attribute, but the value is not supported by the Printer object, i.e., the value is not one of the values of the Printer object's "document-format-supported" attribute, the Printer object MUST reject the request and return the 'client-error-document-format-not-supported' status code.~~ See the description of "document-format" for the Print-Job operation in Section 3.2.1.1. Issue 11

"document-natural-language" (naturalLanguage):

The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this attribute. This attribute specifies the natural language of the document for those document-formats that require a specification of the natural language in order to image the document unambiguously. There are no particular values required for the Printer object to support.

~~"compression" (type3 keyword)~~

~~The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this attribute and the "compression-supported" attribute (see section 4.4.29). The client supplied "compression" operation attribute identifies the compression algorithm used on the document data. If the client omits this attribute, the Printer object MUST assume that the data is not compressed. If the client supplies the attribute and the Printer object supports the attribute, the Printer object MUST use the corresponding decompression algorithm on the document data. If the client supplies this attribute, but the value is not supported by the Printer object, i.e., the value is not one of the values of the Printer object's "compression-supported" attribute, the Printer object MUST copy the attribute~~

2096 ~~and its value to the Unsupported Attributes response group, reject the request, and return the 'client-~~  
2097 ~~error-attributes-or-values-not-supported' status code.~~

2098

2099 "last-document" (boolean):

2100 The client MUST supply this attribute. The Printer object MUST support this attribute. It is a  
2101 boolean flag that is set to 'true' if this is the last document for the Job, 'false' otherwise.

2102

2103 Group 2: Document Content

2104 The client MUST supply the document data if the "last-document" flag is set to 'false'. However,  
2105 since a client might not know that the previous document sent with a Send-Document (or Send-  
2106 URI) operation was the last document (i.e., the "last-document" attribute was set to 'false'), it is legal  
2107 to send a Send-Document request with no document data where the "last-document" flag is set to  
2108 'true'. Such a request MUST NOT increment the value of the Job object's "number-of-documents"  
2109 attribute, since no real document was added to the job.

2110 3.3.1.2 Send-Document Response

2111 The following sets of attributes are part of the Send-Document Response:

2112 Group 1: Operation Attributes

2113 Status Message:

2114 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2115 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2116

2117 Natural Language and Character Set:

2118 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

2119

2120 Group 2: Unsupported Attributes

2121 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
2122 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
2123 ~~[IPP-IIG]). If the Printer object is not returning any Unsupported Attributes in the response, the~~  
2124 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2125 ~~MUST be able to accept an empty group.~~

2126 See section 3.1.7 for details on returning Unsupported Attributes.

2127 Group 3: Job Object Attributes

2128 This is the same set of attributes as described in the Print-Job response (see section 3.2.1.2).

2129

2130 3.3.2 Send-URI Operation

2131 This OPTIONAL operation is identical to the Send-Document operation (see section 3.3.1) except that a  
2132 client MUST supply a URI reference ("document-uri" operation attribute) rather than the document data  
2133 itself. If a Printer object supports this operation, clients can use both Send-URI or Send-Document

2134 operations to add new documents to an existing multi-document Job object. However, if a client needs to  
 2135 indicate that the previous Send-URI or Send-Document was the last document, the client MUST use the  
 2136 Send-Document operation with no document data and the "last-document" flag set to 'true' (rather than  
 2137 using a Send-URI operation with no "document-uri" operation attribute).

2138 If a Printer object supports this operation, it MUST also support the Print-URI operation (see section 3.2.2).

2139 The Printer object MUST validate the syntax and URI scheme of the supplied URI before returning a  
 2140 response, just as in the Print-URI operation. The IPP Printer MAY validate the accessibility of the  
 2141 document as part of the operation or subsequently (see section 3.2.2). Issue 35

### 2142 3.3.3 Cancel-Job Operation

2143 This REQUIRED operation allows a client to cancel a Print Job from the time the job is created up to the  
 2144 time it is completed, canceled, or aborted. Since a Job might already be printing by the time a Cancel-Job is  
 2145 received, some media sheet pages might be printed before the job is actually terminated.

2146 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
 2147 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'pending-held'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok' See Rule 1</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible' See Rule 2</u>
<u>'processing-stopped'</u>	<u>'canceled'</u>	<u>'successful-ok'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'successful-ok' See Rule 1</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible' See Rule 2</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2148 Rule 1: If the implementation requires some measurable time to cancel the job in the 'processing' or  
 2149 'processing-stopped' job states, the IPP object MUST add the 'processing-to-stop-point' value to the job's  
 2150 "job-state-reasons" attribute and then transition the job to the 'canceled' state when the processing ceases  
 2151 (see section 4.3.8).

2152 Rule 2: If the Job object already has the 'processing-to-stop-point' value in its "job-state-reasons" attribute,  
 2153 then the Printer object MUST reject a Cancel-Job operation.

2154 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2155 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2156 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2157 'client-error-not-authorized' as appropriate.

## 2158 3.3.3.1 Cancel-Job Request

2159 The following groups of attributes are part of the Cancel-Job Request:

## 2160 Group 1: Operation Attributes

## 2161 Natural Language and Character Set:

2162 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2163

## 2164 Target:

2165 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation  
2166 attribute(s) which define the target for this operation as described in section 3.1.5.

2167

## 2168 Requesting User Name:

2169 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
2170 described in section 8.3.

2171

## 2172 "message" (text(127)):

2173 The client OPTIONALLY supplies this attribute. The Printer object OPTIONALLY supports this  
2174 attribute. It is a message to the operator. This "message" attribute is not the same as the "job-  
2175 message-from-operator" attribute. That attribute is used to report a message from the operator to the  
2176 end user that queries that attribute. This "message" operation attribute is used to send a message  
2177 from the client to the operator along with the operation request. It is an implementation decision of  
2178 how or where to display this message to the operator (if at all).

2179

## 2180 3.3.3.2 Cancel-Job Response

2181 The following sets of attributes are part of the Cancel-Job Response:

## 2182 Group 1: Operation Attributes

## 2183 Status Message:

2184 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2185 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2186

2187 ~~If the job is already in the 'completed', 'aborted', or 'canceled' state, or the 'process-to-stop-point'  
2188 value is set in the Job's "job-state-reasons" attribute, the Printer object MUST reject the request and  
2189 return the 'client-error-not-possible' error status code.~~

2190

## 2191 Natural Language and Character Set:

2192 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.

2193

## 2194 Group 2: Unsupported Attributes

2195 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by  
2196 the Printer object or that conflict with one another (see section 3.2.1.2 and the Implementer's Guide~~

2197 ~~[IPP-IG]). If the Printer object is not returning any Unsupported Attributes in the response, the~~  
2198 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2199 ~~MUST be able to accept an empty group. See section 3.1.7 for details on returning Unsupported~~  
2200 ~~Attributes.~~

2201

2202 Once a successful response has been sent, the implementation guarantees that the Job will eventually end up  
2203 in the 'canceled' state. Between the time of the Cancel-Job operation is accepted and when the job enters the  
2204 'canceled' job-state (see section 4.3.7), the "job-state-reasons" attribute SHOULD contain the 'processing-  
2205 to-stop-point' value which indicates to later queries that although the Job might still be 'processing', it will  
2206 eventually end up in the 'canceled' state, not the 'completed' state.

### 2207 3.3.4 Get-Job-Attributes Operation

2208 This REQUIRED operation allows a client to request the values of attributes of a Job object and it is almost  
2209 identical to the Get-Printer-Attributes operation (see section 3.2.5). The only differences are that the  
2210 operation is directed at a Job object rather than a Printer object, there is no "document-format" operation  
2211 attribute used when querying a Job object, and the returned attribute group is a set of Job object attributes  
2212 rather than a set of Printer object attributes.

2213 For Jobs, the possible names of attribute groups are:

- 2214 - 'job-template': ~~all~~the subset of the Job Template attributes that apply to a Job object (the first column  
2215 of the table in Section 4.2) that the implementation supports for Job objects.
- 2216 - 'job-description': ~~all~~the subset of the Job Description attributes specified in Section 4.3 that the  
2217 implementation supports for Job objects.
- 2218 - 'all': the special group 'all' that includes all ~~supported attributes~~attributes that the implementation  
2219 supports for Job objects. **Issue 23**

2220

2221 Since a client MAY request specific attributes or named groups, there is a potential that there is some  
2222 overlap. For example, if a client requests, 'job-name' and 'job-description', the client is actually requesting  
2223 the "job-name" attribute once by naming it explicitly, and once by inclusion in the 'job-description' group.  
2224 In such cases, the Printer object NEED NOT return the attribute only once in the response even if it is  
2225 requested multiple times. The client SHOULD NOT request the same attribute in multiple ways.

2226 It is NOT REQUIRED that a Job object support all attributes belonging to a group (since some attributes  
2227 are OPTIONAL). However it is REQUIRED that each Job object support all group names.

#### 2228 3.3.4.1 Get-Job-Attributes Request

2229 The following groups of attributes are part of the Get-Job-Attributes Request when the request is directed at  
2230 a Job object:

2231 Group 1: Operation Attributes

2232 Natural Language and Character Set:

2233 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.1.

2234

2235 Target:

2236 Either (1) the "printer-uri" (uri) plus "job-id" (integer(1:MAX)) or (2) the "job-uri" (uri) operation  
2237 attribute(s) which define the target for this operation as described in section 3.1.5.

2238

2239 Requesting User Name:

2240 The "requesting-user-name" (name(MAX)) attribute SHOULD be supplied by the client as  
2241 described in section 8.3.

2242

2243 "requested-attributes" (1setOf keyword) :

2244 The client OPTIONALLY supplies this attribute. The IPP object MUST support this attribute. It is  
2245 a set of attribute names and/or attribute group names in whose values the requester is interested. If  
2246 the client omits this attribute, the IPP object MUST respond as if this attribute had been supplied  
2247 with a value of 'all'.

2248

#### 2249 3.3.4.2 Get-Job-Attributes Response

2250 The Printer object returns the following sets of attributes as part of the Get-Job-Attributes Response:

##### 2251 Group 1: Operation Attributes

2252 Status Message:

2253 In addition to the REQUIRED status code returned in every response, the response OPTIONALLY  
2254 includes a "status-message" (text(255)) operation attribute as described in sections 13 and 3.1.6.

2255

2256 Natural Language and Character Set:

2257 The "attributes-charset" and "attributes-natural-language" attributes as described in section 3.1.4.2.  
2258 The "attributes-natural-language" MAY be the natural language of the Job object, rather than the  
2259 one requested.

2260

##### 2261 Group 2: Unsupported Attributes

2262 See section 3.1.7 for details on returning Unsupported Attributes.

2263

2264 ~~This is a set of Operation attributes supplied by the client (in the request) that are not supported by~~  
2265 ~~the Printer object or that conflict with one another (see sections 3.2.1.2 and the Implementer's Guide~~  
2266 ~~[IPP-IG]).~~ The response NEED NOT contain the "requested-attributes" operation attribute with  
2267 any supplied values (attribute keywords) that were requested by the client but are not supported by  
2268 the IPP object. If the Printer object ~~is not returning any Unsupported Attributes in the response, the~~  
2269 ~~Printer object SHOULD omit Group 2 rather than sending an empty group. However, a client~~  
2270 ~~MUST be able to accept an empty group.~~

2271 does include unsupported attributes referenced in "requested-attributes" and such attributes include  
 2272 group names, such as 'all', the unsupported attributes MUST NOT include attributes described in the  
 2273 standard but not supported by the implementation. Issue 23  
 2274

### 2275 Group 3: Job Object Attributes

2276 This is the set of requested attributes and their current values. The IPP object ignores (does not  
 2277 respond with) any requested attribute or value which is not supported or which is restricted by the  
 2278 security policy in force, including whether the requesting user is the user that submitted the job (job  
 2279 originating user) or not (see section 8). However, the IPP object MUST respond with the 'unknown'  
 2280 value for any supported attribute (including all REQUIRED attributes) for which the IPP object does  
 2281 not know the value, unless it would violate the security policy. See the description of the "out-of-  
 2282 band" values in the beginning of Section 4.1.

#### 2283 3.3.5 Hold-Job Operation

2284 This OPTIONAL operation allows a client to hold a pending job in the queue so that it is not eligible for  
 2285 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,  
 2286 and vice-versa. The OPTIONAL "job-hold-until" operation attribute allows a client to specify whether to  
 2287 hold the job indefinitely or until a specified time period, if supported.

2288 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
 2289 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Rule 1</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok' See Rule 2</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Rule 1</u>
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok' See Rule 2</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2290 Rule 1: If the implementation supports multiple reasons for a job to be in the 'pending-held' state, the IPP  
 2291 object MUST add the 'job-hold-until-specified' value to the job's "job-state-reasons" attribute.

2292 Rule 2: If the IPP object supports the "job-hold-until" operation attribute, but the specified time period has  
 2293 already started (or is the 'no-hold' value) and there are no other reasons to hold the job, the IPP object  
 2294 MUST make the job be a candidate for processing immediately (see Section 4.2.2) by putting the job in the  
 2295 'pending' state.

2296 Note: In order to keep the Hold-Job operation simple, such a request is rejected when the job is in the  
 2297 'processing' or 'processing-stopped' states. If an operation is needed to hold jobs while in these states, it will

2298 be added as an additional operation, rather than overloading the Hold-Job operation. Then it is clear to  
2299 clients by querying the Printer object's "operations-supported" (see Section 4.4.15) and the Job object's  
2300 "job-state" (see Section 4.3.7) attributes which operations are possible.

2301 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
2302 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
2303 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
2304 'client-error-not-authorized' as appropriate.

### 2305 3.3.5.1 Hold-Job Request

2306 The groups and operation attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the  
2307 addition of the following Group 1 Operation attribute:

2308 "job-hold-until" (type3 keyword | name(MAX)):

2309 The client OPTIONALLY supplies this Operation attribute. The IPP object MUST support this  
2310 operation attribute in a Hold-Job request, if it supports the "job-hold-until" Job template attribute in  
2311 create operations. See section 4.2.2. The IPP object SHOULD support the "job-hold-until" Job  
2312 Template attribute for use in job create operations with at least the 'indefinite' value, if it supports  
2313 the Hold-Job operation. Otherwise, a client cannot create a job and hold it immediately (without  
2314 picking some supported time period in the future).

2315 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP  
2316 object copies the supplied operation attribute to the Job object, replacing the job's previous "job-  
2317 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied  
2318 named time period.

2319 If supplied, but either the "job-hold-until" Operation attribute itself or the value supplied is not  
2320 supported, the IPP object accepts the request, returns the unsupported attribute or value in the  
2321 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-  
2322 substituted-attributes, and holds the job indefinitely until a client performs a subsequent Release-Job  
2323 operation.

2324 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'  
2325 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation  
2326 attribute and there are no other reasons to hold the job, the IPP object MUST accept the operation  
2327 and make the job be a candidate for processing immediately (see Section 4.2.2).

2328 If the client does not supply a "job-hold-until" Operation attribute in the request, the IPP object  
2329 MUST populate the job object with a "job-hold-until" attribute with the 'indefinite' value (if IPP  
2330 object supports the "job-hold-until" attribute) and hold the job indefinitely, until a client performs a  
2331 Release-Job operation.

### 2332 3.3.5.2 Hold-Job Response

2333 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2334 3.3.6 Release-Job Operation

2335 This OPTIONAL operation allows a client to release a previously held job so that it is again eligible for  
 2336 scheduling. If the Hold-Job operation is supported, then the Release-Job operation MUST be supported,  
 2337 and vice-versa.

2338 This operation removes the "job-hold-until" job attribute, if present, from the job object that had been  
 2339 supplied in the create or most recent Hold-Job or Restart-Job operation and remove its effect on the job.  
 2340 **Issue 30** The IPP object MUST remove the 'job-hold-until-specified' value from the job's "job-state-  
 2341 reasons" attribute, if present. See section 4.3.8.

2342 The IPP object MUST accept or reject the request based on the job's current state and transition the job to  
 2343 the indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'successful-ok' See Rule 1</u>
<u>'pending-held'</u>	<u>'pending'</u>	<u>'successful-ok'</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'successful-ok' No effect on the job.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible'</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible'</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible'</u>

2344 Rule 1: If there are other reasons to keep the job in the 'pending-held' state, such as 'resources-are-not-  
 2345 ready', the job remains in the 'pending-held' state. Thus the 'pending-held' state is not just for jobs that have  
 2346 the 'job-hold-until' applied to them, but are for any reason to keep the job from being a candidate for  
 2347 scheduling and processing, such as 'resources-are-not-ready'. See the "job-hold-until" attribute (section  
 2348 4.2.2).

2349 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2350 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2351 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2352 'client-error-not-authorized' as appropriate.

2353 The Release-Job Request and Release-Job Response have the same attribute groups and attributes as the  
 2354 Cancel-Job operation (see section 3.3.3.1 and 3.3.3.2).

2355 3.3.7 Restart-Job Operation

2356 This OPTIONAL operation allows a client to restart a job that is retained in the queue after processing has  
 2357 completed (see section 4.3.7.2).

2358 The job is moved to the 'pending' job state and restarts at the beginning on the same IPP Printer object with  
 2359 the same attribute values. The Job Description attributes that accumulate job progress, such as "job-

2360 impressions-completed", "job-media-sheets-completed", and "job-k-octets-processed", MUST be reset to 0  
 2361 so that they give an accurate record of the job from its restart point. The job object MUST continue to use  
 2362 the same "job-uri" and "job-id" attribute values.

2363 Note: If in the future an operation is needed that does not reset the job progress attributes, then a new  
 2364 operation will be defined which makes a copy of the job, assigns a new "job-uri" and "job-id" to the copy  
 2365 and resets the job progress attributes in the new copy only.

2366 The IPP object MUST accept or reject the request based on the job's current state, transition the job to the  
 2367 indicated new state as follows:

<u>Current "job-state"</u>	<u>New "job-state"</u>	<u>IPP object's response status code and action:</u>
<u>'pending'</u>	<u>'pending'</u>	<u>'client-error-not-possible'.</u>
<u>'pending-held'</u>	<u>'pending-held'</u>	<u>'client-error-not-possible'.</u>
<u>'processing'</u>	<u>'processing'</u>	<u>'client-error-not-possible'.</u>
<u>'processing-stopped'</u>	<u>'processing-stopped'</u>	<u>'client-error-not-possible'.</u>
<u>'completed'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'completed'</u>	<u>'completed'</u>	<u>'client-error-not-possible' - see Rule 1</u>
<u>'canceled'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'canceled'</u>	<u>'canceled'</u>	<u>'client-error-not-possible' - see Rule 1</u>
<u>'aborted'</u>	<u>'pending'</u>	<u>'successful-ok' - job is started over.</u>
<u>'aborted'</u>	<u>'aborted'</u>	<u>'client-error-not-possible' - see Rule 1</u>

2368

2369 Rule 1: If the Job Retention Period has expired for the job in this state, then the IPP object rejects the  
 2370 operation. See section 4.3.7.2.

2371 Note: In order to prevent a user from inadvertently restarting a job in the middle, the Restart-Job request is  
 2372 rejected when the job is in the 'processing' or 'processing-stopped' states. If in the future an operation is  
 2373 needed to hold or restart jobs while in these states, it will be added as an additional operation, rather than  
 2374 overloading the Restart-Job operation, so that it is clear that the user intended that the current job not be  
 2375 completed.

2376 Access Rights: The authenticated user (see section 8.3) performing this operation must either be the job  
 2377 owner or an operator or administrator of the Printer object (see Sections 1 and 8.5). Otherwise, the IPP  
 2378 object MUST reject the operation and return: 'client-error-forbidden', 'client-error-not-authenticated', or  
 2379 'client-error-not-authorized' as appropriate.

### 2380 3.3.7.1 Restart-Job Request

2381 The groups and attributes are the same as for a Cancel-Job request (see section 3.3.3.1), with the addition of  
 2382 the following Group 1 Operation attribute:

2383 "job-hold-until" (type3 keyword | name(MAX)):  
2384 The client OPTIONALLY supplies this attribute. The IPP object MUST support this Operation  
2385 attribute in a Restart-Job request, if it supports the "job-hold-until" Job Template attribute in create  
2386 operations. See section 4.2.2. Otherwise, the IPP object NEED NOT support the "job-hold-until"  
2387 Operation attribute in a Restart-Job request.

2388 If supplied and supported as specified in the Printer's "job-hold-until-supported" attribute, the IPP  
2389 object copies the supplied Operation attribute to the Job object, replacing the job's previous "job-  
2390 hold-until" attribute, if present, and makes the job a candidate for scheduling during the supplied  
2391 named time period. See section 4.2.2.

2392 If supplied, but the value is not supported, the IPP object accepts the request, returns the  
2393 unsupported attribute or value in the Unsupported Attributes Group according to section 3.1.7,  
2394 returns the 'successful-ok-ignored-or-substituted-attributes' status code, and holds the job  
2395 indefinitely until a client performs a subsequent Release-Job operation.

2396 If supplied, but the "job-hold-until" Operation attribute itself is not supported, the IPP object accepts  
2397 the request, returns the unsupported attribute with the out-of-band 'unsupported' value in the  
2398 Unsupported Attributes Group according to section 3.1.7, returns the 'successful-ok-ignored-or-  
2399 substituted-attributes' status code, and restarts the job, i.e., ignores the "job-hold-until" attribute.

2400 If the client (1) supplies a value that specifies a time period that has already started or the 'no-hold'  
2401 value (meaning don't hold the job) and (2) the IPP object supports the "job-hold-until" operation  
2402 attribute and there are no other reasons to hold the job, the IPP object makes the job a candidate for  
2403 processing immediately (see Section 4.2.2).

2404 If the client does not supply a "job-hold-until" operation attribute in the request, the IPP object  
2405 removes the "job-hold-until" attribute, if present, from the job. If there are no other reasons to hold  
2406 the job, the Restart-Job operation makes the job a candidate for processing immediately (see Section  
2407 4.2.2).

2408 **3.3.7.2 Restart-Job Response**

2409 The groups and attributes are the same as for a Cancel-Job response (see section 3.3.3.2).

2410 Note: In the future an OPTIONAL Modify-Job or Set-Job-Attributes operation may be specified that  
2411 allows the client to modify other attributes before releasing the restarted job.

#### 2412 4. Object Attributes

2413 This section describes the attributes with their corresponding attribute syntaxes and values that are part of  
2414 the IPP model. The sections below show the objects and their associated attributes which are included  
2415 within the scope of this protocol. Many of these attributes are derived from other relevant  
2416 [specification documents](#):

2417 - Document Printing Application (DPA) [ISO10175]

2418 - RFC 1759 Printer MIB [RFC1759]

2419

2420 Each attribute is uniquely identified in this document using a "keyword" (see section 12.2.1) which is the  
2421 name of the attribute. The keyword is included in the section header describing that attribute.

2422 Note: Not only are keywords used to identify attributes, but one of the attribute syntaxes described below is  
2423 "keyword" so that some attributes have keyword values. Therefore, these attributes are defined as having  
2424 an attribute syntax that is a set of keywords.

#### 2425 4.1 Attribute Syntaxes

2426 This section defines the basic attribute syntax types that all clients and IPP objects MUST be able to accept  
2427 in responses and accept in requests, respectively. Each attribute description in sections 3 and 4 includes the  
2428 name of attribute syntax(es) in the heading (in parentheses). A conforming implementation of an attribute  
2429 MUST include the semantics of the attribute syntax(es) so identified. Section 6.3 describes how the  
2430 protocol can be extended with new attribute syntaxes.

2431 The attribute syntaxes are specified in the following sub-sections, where the sub-section heading is the  
2432 keyword name of the attribute syntax inside the single quotes. In operation requests and responses each  
2433 attribute value MUST be represented as one of the attribute syntaxes specified in the sub-section heading  
2434 for the attribute. In addition, the value of an attribute in a response (but not in a request) MAY be one of  
2435 the "out-of-band" values whose special encoding rules are defined in the "Encoding and Transport"  
2436 document [IPP-PRO]. Standard "out-of-band" values are: Issue 12 and Issue 15

2437 'unknown': The attribute is supported by the IPP object, but the value is unknown to the IPP object for  
2438 some reason.

2439 'unsupported': The attribute is unsupported by the IPP object. This value MUST be returned only as the  
2440 value of an attribute in the Unsupported Attributes Group.

2441 'no-value': The attribute is supported by the Printer object, but the system administrator has not yet  
2442 configured a value.

2443

2444 ~~The Encoding and Transport specification [IPP-PRO] defines mechanisms for passing "out-of-band"~~  
2445 ~~values.~~ All attributes in a request MUST have one or more values as defined in Sections 4.2 to 4.4. Thus  
2446 clients MUST NOT supply attributes with "out-of-band" values. All attributes in a response MUST have  
2447 one or more values as defined in Sections 4.2 to 4.4 or a single "out-of-band" value.

2448 Most attributes are defined to have a single attribute syntax. However, a few attributes (e.g., "job-sheet",  
2449 "media", "job-hold-until") are defined to have several attribute syntaxes, depending on the value. These  
2450 multiple attribute syntaxes are separated by the "|" character in the sub-section heading to indicate the  
2451 choice. Since each value MUST be tagged as to its attribute syntax in the protocol, a single-valued attribute  
2452 instance may have any one of its attribute syntaxes and a multi-valued attribute instance may have a mixture  
2453 of its defined attribute syntaxes.

## 2454 4.1.1 'text'

2455 A text attribute is an attribute whose value is a sequence of zero or more characters encoded in a maximum  
2456 of 1023 ('MAX') octets. MAX is the maximum length for each value of any text attribute. However, if an  
2457 attribute will always contain values whose maximum length is much less than MAX, the definition of that  
2458 attribute will include a qualifier that defines the maximum length for values of that attribute. For example:  
2459 the "printer-location" attribute is specified as "printer-location (text(127))". In this case, text values for  
2460 "printer-location" MUST NOT exceed 127 octets; if supplied with a longer text string via some external  
2461 interface (other than the protocol), implementations are free to truncate to this shorter length limitation.

2462 In this [specification document](#), all text attributes are defined using the 'text' syntax. However, 'text' is used  
2463 only for brevity; the formal interpretation of 'text' is: 'textWithoutLanguage | textWithLanguage'. That is,  
2464 for any attribute defined in this [specification document](#) using the 'text' attribute syntax, all IPP objects and  
2465 clients MUST support both the 'textWithoutLanguage' and 'textWithLanguage' attribute syntaxes.  
2466 However, in actual usage and protocol execution, objects and clients accept and return only one of the two  
2467 syntax per attribute. The syntax 'text' never appears "on-the-wire".

2468 Both 'textWithoutLanguage' and 'textWithLanguage' are needed to support the real world needs of  
2469 interoperability between sites and systems that use different natural languages as the basis for human  
2470 communication. Generally, one natural language applies to all text attributes in a given request or response.  
2471 The language is indicated by the "attributes-natural-language" operation attribute defined in section 3.1.4 or  
2472 "attributes-natural-language" job attribute defined in section 4.3.20, and there is no need to identify the  
2473 natural language for each text string on a value-by-value basis. In these cases, the attribute syntax  
2474 'textWithoutLanguage' is used for text attributes. In other cases, the client needs to supply or the Printer  
2475 object needs to return a text value in a natural language that is different from the rest of the text values in  
2476 the request or response. In these cases, the client or Printer object uses the attribute syntax  
2477 'textWithLanguage' for text attributes (this is the Natural Language Override mechanism described in  
2478 section 3.1.4).

2479 The 'textWithoutLanguage' and 'textWithLanguage' attribute syntaxes are described in more detail in the  
2480 following sections.

## 2481 4.1.1.1 'textWithoutLanguage'

2482 The 'textWithoutLanguage' syntax indicates a value that is sequence of zero or more characters. Text  
2483 strings are encoded using the rules of some charset. The Printer object MUST support the UTF-8 charset  
2484 [\[RFC2044\]](#)[\[RFC2279\]](#) and MAY support additional charsets to represent 'text' values, provided that the  
2485 charsets are registered with IANA [IANA-CS]. See Section 4.1.7 for the [specification definition](#) of the  
2486 'charset' attribute syntax, including restricted semantics and examples of charsets.

## 2487 4.1.1.2 'textWithLanguage'

2488 The 'textWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2489 'textWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides the  
2490 natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that applies  
2491 to the text part of that value and that value alone. For any give text attribute, the 'textWithoutLanguage' part

2492 is limited to the maximum length defined for that attribute, but the 'naturalLanguage' part is always limited  
2493 to 63 octets. Using the 'textWithLanguage' attribute syntax rather than the normal 'textWithoutLanguage'  
2494 syntax is the so-called Natural Language Override mechanism and MUST be supported by all IPP objects  
2495 and clients.

2496 If the attribute is multi-valued (1setOf text), then the 'textWithLanguage' attribute syntax MUST be used to  
2497 explicitly specify each attribute value whose natural language needs to be overridden. Other values in a  
2498 multi-valued 'text' attribute in a request or a response revert to the natural language of the operation  
2499 attribute.

2500 In a create request, the Printer object MUST accept and store with the Job object any natural language in the  
2501 "attributes-natural-language" operation attribute, whether the Printer object supports that natural language  
2502 or not. Furthermore, the Printer object MUST accept and store any 'textWithLanguage' attribute value,  
2503 whether the Printer object supports that natural language or not. These requirements are independent of the  
2504 value of the "ipp-attribute-fidelity" operation attribute that the client MAY supply.

2505 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2506 indicating English, but the value of the "job-name" attribute is in French, the client MUST use the  
2507 'textWithLanguage' attribute syntax with the following two values:

2508       'fr': Natural Language Override indicating French

2509       'Rapport Mensuel': the job name in French

2510

2511 See the ~~Encoding and Transport~~ ["Encoding and Transport"](#) document [IPP-PRO] for a detailed example of  
2512 the 'textWithLanguage' attribute syntax.

#### 2513 4.1.2 'name'

2514 This syntax type is used for user-friendly strings, such as a Printer name, that, for humans, are more  
2515 meaningful than identifiers. Names are never translated from one natural language to another. The 'name'  
2516 attribute syntax is essentially the same as 'text', including the REQUIRED support of UTF-8 except that the  
2517 sequence of characters is limited so that its encoded form MUST NOT exceed 255 (MAX) octets.

2518 Also like 'text', 'name' is really an abbreviated notation for either 'nameWithoutLanguage' or  
2519 'nameWithLanguage'. That is, all IPP objects and clients MUST support both the 'nameWithoutLanguage'  
2520 and 'nameWithLanguage' attribute syntaxes. However, in actual usage and protocol execution, objects and  
2521 clients accept and return only one of the two syntax per attribute. The syntax 'name' never appears "on-the-  
2522 wire".

2523 ~~Note:~~ Only the 'text' and 'name' attribute syntaxes permit the Natural Language Override mechanism.

2524 Some attributes are defined as 'type3 keyword | name'. These attributes support values that are either type3  
2525 keywords or names. This dual-syntax mechanism enables a site administrator to extend these attributes to  
2526 legally include values that are locally defined by the site administrator. Such names are not registered with  
2527 IANA.

## 2528 4.1.2.1 'nameWithoutLanguage'

2529 The 'nameWithoutLanguage' syntax indicates a value that is sequence of zero or more characters so that its  
2530 encoded form does not exceed MAX octets.

## 2531 4.1.2.2 'nameWithLanguage'

2532 The 'nameWithLanguage' attribute syntax is a compound attribute syntax consisting of two parts: a  
2533 'nameWithoutLanguage' part plus an additional 'naturalLanguage' (see section 4.1.8) part that overrides the  
2534 natural language in force. The 'naturalLanguage' part explicitly identifies the natural language that applies  
2535 to that name value and that name value alone.

2536 The 'nameWithLanguage' attribute syntax behaves the same as the 'textWithLanguage' syntax. If a name is  
2537 in a language that is different than the rest of the object or operation, then this 'nameWithLanguage' syntax  
2538 is used rather than the generic 'nameWithoutLanguage' syntax.

2539 Example: If the client supplies the "attributes-natural-language" operation attribute with the value: 'en'  
2540 indicating English, but the "printer-name" attribute is in German, the client MUST use the  
2541 'nameWithLanguage' attribute syntax as follows:

2542 'de': Natural Language Override indicating German  
2543 'Farbdrucker': the Printer name in German  
2544

## 2545 4.1.2.3 Matching 'name' attribute values

2546 For purposes of matching two 'name' attribute values for equality, such as in job validation (where a client-  
2547 supplied value for attribute "xxx" is checked to see if the value is among the values of the Printer object's  
2548 corresponding "xxx-supported" attribute), the following match rules apply:

2549 1. 'keyword' values never match 'name' values.

2550 2. 'name' (nameWithoutLanguage and nameWithLanguage) values match if (1) the name parts  
2551 match and (2) the Associated Natural-Language parts (see section 3.1.4.1) match. The matching  
2552 rules are:

2553 a. the name parts match if the two names are identical character by character, except it is  
2554 RECOMMENDED that case be ignored. For example: 'Ajax-letter-head-white' MUST  
2555 match 'Ajax-letter-head-white' and SHOULD match 'ajax-letter-head-white' and 'AJAX-  
2556 LETTER-HEAD-WHITE'.

2557 b. the Associated Natural-Language parts match if the shorter of the two meets the syntactic  
2558 requirements of RFC 1766 [RFC1766] and matches byte for byte with the longer. For  
2559 example, 'en' matches 'en', 'en-us' and 'en-gb', but matches neither 'fr' nor 'e'.

## 2560 4.1.3 'keyword'

2561 The 'keyword' attribute syntax is a sequence of characters, length: 1 to 255, containing only the US-ASCII  
2562 [ASCII] encoded values for lowercase letters ("a" - "z"), digits ("0" - "9"), hyphen ("-"), dot ("."), and  
2563 underscore ("\_"). The first character MUST be a lowercase letter. Furthermore, keywords MUST be in  
2564 U.S. English.

2565 This syntax type is used for enumerating semantic identifiers of entities in the abstract protocol, i.e., entities  
2566 identified in this document. Keywords are used as attribute names or values of attributes. Unlike 'text' and  
2567 'name' attribute values, 'keyword' values MUST NOT use the Natural Language Override mechanism, since  
2568 they MUST always be US-ASCII and U.S. English.

2569 Keywords are for use in the protocol. A user interface will likely provide a mapping between protocol  
2570 keywords and displayable user-friendly words and phrases which are localized to the natural language of  
2571 the user. While the keywords specified in this document MAY be displayed to users whose natural  
2572 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since  
2573 the user interface is outside the scope of this document.

2574 In the definition for each attribute of this syntax type, the full set of defined keyword values for that  
2575 attribute are listed.

2576 When a keyword is used to represent an attribute (its name), it MUST be unique within the full scope of all  
2577 IPP objects and attributes. When a keyword is used to represent a value of an attribute, it MUST be unique  
2578 just within the scope of that attribute. That is, the same keyword MUST NOT be used for two different  
2579 values within the same attribute to mean two different semantic ideas. However, the same keyword MAY  
2580 be used across two or more attributes, representing different semantic ideas for each attribute. Section 6.1  
2581 describes how the protocol can be extended with new keyword values. Examples of attribute name  
2582 keywords:

2583 "job-name"  
2584 "attributes-charset"  
2585

2586 Note: This document uses "type1", "type2", and "type3" prefixes to the "keyword" basic syntax to indicate  
2587 different levels of review for extensions (see section 6.1).

## 2588 4.1.4 'enum'

2589 The 'enum' attribute syntax is an enumerated integer value that is in the range from 1 to  $2^{*}31 - 1$  (MAX).  
2590 Each value has an associated 'keyword' name. In the definition for each attribute of this syntax type, the full  
2591 set of possible values for that attribute are listed. This syntax type is used for attributes for which there are  
2592 enum values assigned by other standards, such as SNMP MIBs. A number of attribute enum values in this  
2593 [specification document](#) are also used for corresponding attributes in other standards [RFC1759]. This  
2594 syntax type is not used for attributes to which the [system](#) administrator may assign values. Section 6.1  
2595 describes how the protocol can be extended with new enum values.

2596 Enum values are for use in the protocol. A user interface will provide a mapping between protocol enum  
2597 values and displayable user-friendly words and phrases which are localized to the natural language of the  
2598 user. While the enum symbols specified in this document MAY be displayed to users whose natural  
2599 language is U.S. English, they MAY be mapped to other U.S. English words for U.S. English users, since  
2600 the user interface is outside the scope of this document.

2601 Note: SNMP MIBs use '2' for 'unknown' which corresponds to the IPP "out-of-band" value 'unknown'. See  
2602 the description of the "out-of-band" values at the beginning of Section 4.1. Therefore, attributes of type  
2603 'enum' start at '3'.

2604 Note: This document uses "type1", "type2", and "type3" prefixes to the "enum" basic syntax to indicate  
2605 different levels of review for extensions (see section 6.1).

#### 2606 4.1.5 'uri'

2607 The 'uri' attribute syntax is any valid Uniform Resource Identifier or URI [RFC2396]. Most often, URIs are  
2608 simply Uniform Resource Locators or URLs. The maximum length of URIs used as values of IPP  
2609 attributes is 1023 octets. Although most other IPP attribute syntax types allow for only lower-cased values,  
2610 this attribute syntax type conforms to the case-sensitive and case-insensitive rules specified in [RFC2396].  
2611 [See also \[IPP-IIG\] for a discussion of case in URIs.](#)

#### 2612 4.1.6 'uriScheme'

2613 The 'uriScheme' attribute syntax is a sequence of characters representing a URI scheme according to RFC  
2614 2396 [RFC2396]. Though RFC 2396 requires that the values be case-insensitive, IPP requires all lower  
2615 case values in IPP attributes to simplify comparing by IPP clients and Printer objects.

2616 Standard values for this syntax type are the following keywords:

2617 ['ipp': for IPP schemed URIs \(e.g., "ipp:..."\)](#)  
2618 ['http': for HTTP schemed URIs \(e.g., "~~http:...~~"\["http:..."\]\(#\)\)](#)  
2619 'https': for use with HTTPS schemed URIs (e.g., "https:...") (not on IETF standards track)  
2620 'ftp': for FTP schemed URIs (e.g., "ftp:...")  
2621 'mailto': for SMTP schemed URIs (e.g., "mailto:...")  
2622 'file': for file schemed URIs (e.g., "file:...")

2624 A Printer object MAY support any URI 'scheme' that has been registered with IANA [IANA-MT]. The  
2625 maximum length of URI 'scheme' values used to represent IPP attribute values is 63 octets.

#### 2626 4.1.7 'charset'

2627 The 'charset' attribute syntax is a standard identifier for a charset. A charset is a coded character set and  
2628 encoding scheme. Charsets are used for labeling certain document contents and 'text' and 'name' attribute  
2629 values. The syntax and semantics of this attribute syntax are specified in RFC 2046 [RFC2046] and  
2630 contained in the IANA character-set Registry [IANA-CS] according to the IANA procedures [RFC2278].  
2631 Though RFC 2046 requires that the values be case-insensitive US-ASCII, IPP requires all lower case values

2632 in IPP attributes to simplify comparing by IPP clients and Printer objects. When a character-set in the  
2633 IANA registry has more than one name (alias), the name labeled as "(preferred MIME name)", if present,  
2634 MUST be used.

2635 The maximum length of 'charset' values used to represent IPP attribute values is 63 octets.

2636 Some examples are:

- 2637 'utf-8': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as the UTF-8  
2638 [RFC2279] transfer encoding scheme in which US-ASCII is a subset charset.
- 2639 'us-ascii': 7-bit American Standard Code for Information Interchange (ASCII), ANSI X3.4-1986  
2640 [ASCII]. That standard defines US-ASCII, but RFC 2045 [RFC2045] eliminates most of the control  
2641 characters from conformant usage in MIME and IPP.
- 2642 'iso-8859-1': 8-bit One-Byte Coded Character Set, Latin Alphabet Nr 1 [ISO8859-1]. That standard  
2643 defines a coded character set that is used by Latin languages in the Western Hemisphere and  
2644 Western Europe. US-ASCII is a subset charset.
- 2645 'iso-10646-ucs-2': ISO 10646 Universal Multiple-Octet Coded Character Set (UCS) represented as two  
2646 octets (UCS-2), with the high order octet of each pair coming first (so-called Big Endian integer).

2648 Some attribute descriptions MAY place additional requirements on charset values that may be used, such as  
2649 REQUIRED values that MUST be supported or additional restrictions, such as requiring that the charset  
2650 have US-ASCII as a subset charset.

#### 2651 4.1.8 'naturalLanguage'

2652 The 'naturalLanguage' attribute syntax is a standard identifier for a natural language and optionally a  
2653 country. The values for this syntax type are defined by RFC 1766 [RFC1766]. Though RFC 1766 requires  
2654 that the values be case-insensitive US-ASCII, IPP requires all lower case to simplify comparing by IPP  
2655 clients and Printer objects. Examples include:

- 2656 'en': for English
- 2657 'en-us': for US English
- 2658 'fr': for French
- 2659 'de': for German

2660

2661 The maximum length of 'naturalLanguage' values used to represent IPP attribute values is 63 octets.

#### 2662 4.1.9 'mimeMediaType'

2663 The 'mimeMediaType' attribute syntax is the Internet Media Type (sometimes called MIME type) as  
2664 defined by RFC 2046 [RFC2046] and registered according to the procedures of RFC 2048 [RFC2048] for  
2665 identifying a document format. The value MAY include a charset parameter, depending on the  
2666 specification of the Media Type in the IANA Registry [IANA-MT]. Although most other IPP syntax types  
2667 allow for only lower-cased values, this syntax type allows for mixed-case values which are case-insensitive.

2668 Examples are:

2669 `text/html`: An HTML document  
2670 `text/plain`: A plain text document in US-ASCII (RFC 2046 indicates that in the absence of the charset  
2671 parameter MUST mean US-ASCII rather than simply unspecified) [RFC2046].  
2672 `text/plain; charset=US-ASCII`: A plain text document in US-ASCII [52, 56].  
2673 `text/plain; charset=ISO-8859-1`: A plain text document in ISO 8859-1 (Latin 1) [ISO8859-1].  
2674 `text/plain; charset=utf-8`: A plain text document in ISO 10646 represented as UTF-8  
2675 ~~[RFC2044][RFC2279]~~  
2676 ~~`text/plain, charset=iso-10646-ucs-2`: A plain text document in ISO 10646 represented in two octets~~  
2677 ~~(UCS-2) [ISO10646-1]~~  
2678 `application/postscript`: A PostScript document [RFC2046]  
2679 `application/vnd.hp-PCL`: A PCL document [IANA-MT] (charset escape sequence embedded in the  
2680 document data)  
2681 [`application/pdf`: Portable Document Format - see IANA MIME Media Type registry](#)  
2682 `application/octet-stream`: Auto-sense - see [below section 4.1.9.1](#)  
2683

#### 2684 [4.1.9.1 Application/octet-stream -- Auto-Sensing the document format](#)

2685 One special type is `application/octet-stream`. If the Printer object supports this value, the Printer object  
2686 MUST be capable of auto-sensing the format of the document [data, either as part of the create operation](#)  
2687 [and/or at document processing time. During auto-sensing, a Printer may determine that the document-data](#)  
2688 [has a format data—that the Printer doesn't recognize. If the Printer determines this problem before returning](#)  
2689 [an operation response, it rejects the request and returns the 'client-error-document-format-not-supported'](#)  
2690 [status code. If the Printer determines this problem after accepting the request and returning an operation](#)  
2691 [response with one of the successful status codes, the Printer adds the 'unsupported-document-format' value](#)  
2692 [to the job's "job-state-reasons" attribute. Issue 9 and Issue 10](#)

2693 If the Printer object's default value attribute "document-format-default" is set to `application/octet-stream`,  
2694 the Printer object not only supports auto-sensing of the document format, but will depend on the result of  
2695 applying its auto-sensing when the client does not supply the "document-format" attribute. If the client  
2696 supplies a document format value, the Printer MUST rely on the supplied attribute, rather than trust its  
2697 auto-sensing algorithm. To summarize:

- 2698 1. If the client does not supply a document format value, the Printer MUST rely on its default value  
2699 setting (which may be `application/octet-stream` indicating an auto-sensing mechanism).
- 2700 2. If the client supplies a value other than `application/octet-stream`, the client is supplying valid  
2701 information about the format of the document data and the Printer object MUST trust the client  
2702 supplied value more than the outcome of applying an automatic format detection mechanism. For  
2703 example, the client may be requesting the printing of a PostScript file as a `text/plain` document.  
2704 The Printer object MUST print a text representation of the PostScript commands rather than  
2705 interpret the stream of PostScript commands and print the result.
- 2706 3. If the client supplies a value of `application/octet-stream`, the client is indicating that the Printer  
2707 object MUST use its auto-sensing mechanism on the client supplied document data whether auto-  
2708 sensing is the Printer object's default or not.
- 2709

2710 Note: Since the auto-sensing algorithm is probabilistic, if the client requests both auto-sensing ("document-  
2711 format" set to 'application/octet-stream') and true fidelity ("ipp-attribute-fidelity" set to 'true'), the Printer  
2712 object might not be able to guarantee exactly what the end user intended (the auto-sensing algorithm might  
2713 mistake one document format for another), but it is able to guarantee that its auto-sensing mechanism be  
2714 used.

2715 The maximum length of a 'mimeType' value to represent IPP attribute values is 255 octets.

#### 2716 4.1.10 'octetString'

2717 The 'octetString' attribute syntax is a sequence of octets encoded in a maximum of 1023 octets which is  
2718 indicated in sub-section headers using the notation: octetString(MAX). This syntax type is used for opaque  
2719 data.

#### 2720 4.1.11 'boolean'

2721 The 'boolean' attribute syntax has only two values: 'true' and 'false'.

#### 2722 4.1.12 'integer'

2723 The 'integer' attribute syntax is an integer value that is in the range from  $-2^{31}$  (MIN) to  $2^{31} - 1$  (MAX).  
2724 Each individual attribute may specify the range constraint explicitly in sub-section headers if the range is  
2725 different from the full range of possible integer values. For example: job-priority (integer(1:100)) for the  
2726 "job-priority" attribute. However, the enforcement of that additional constraint is up to the IPP objects, not  
2727 the protocol.

#### 2728 4.1.13 'rangeOfInteger'

2729 The 'rangeOfInteger' attribute syntax is an ordered pair of integers that defines an inclusive range of integer  
2730 values. The first integer specifies the lower bound and the second specifies the upper bound. If a range  
2731 constraint is specified in the header description for an attribute in this document whose attribute syntax is  
2732 'rangeOfInteger' (i.e., 'X:Y' indicating X as a minimum value and Y as a maximum value), then the  
2733 constraint applies to both integers.

#### 2734 4.1.14 'dateTime'

2735 The 'dateTime' attribute syntax is a standard, fixed length, 11 octet representation of the "DateAndTime"  
2736 syntax as defined in RFC ~~2579~~1903 [RFC~~2579~~1903]. RFC ~~1903~~2579 also identifies an 8 octet  
2737 representation of a "DateAndTime" value, but IPP objects MUST use the 11 octet representation. A user  
2738 interface will provide a mapping between protocol dateTime values and displayable user-friendly words or  
2739 presentation values and phrases which are localized to the natural language and date format of the user,  
2740 including time zone.

## 2741 4.1.15 'resolution'

2742 The 'resolution' attribute syntax specifies a two-dimensional resolution in the indicated units. It consists of  
2743 3 values: a cross feed direction resolution (positive integer value), a feed direction resolution (positive  
2744 integer value), and a units value. The semantics of these three components are taken from the Printer MIB  
2745 [RFC1759] suggested values. That is, the cross feed direction component resolution component is the same  
2746 as the prtMarkerAddressabilityXFeedDir object in the Printer MIB, the feed direction component resolution  
2747 component is the same as the prtMarkerAddressabilityFeedDir in the Printer MIB, and the units component  
2748 is the same as the prtMarkerAddressabilityUnit object in the Printer MIB (namely, '3' indicates dots per inch  
2749 and '4' indicates dots per centimeter). All three values MUST be present even if the first two values are the  
2750 same. Example: '300', '600', '3' indicates a 300 dpi cross-feed direction resolution, a 600 dpi feed direction  
2751 resolution, since a '3' indicates dots per inch (dpi).

## 2752 4.1.16 '1setOf X'

2753 The '1setOf X' attribute syntax is 1 or more values of attribute syntax type X. This syntax type is used for  
2754 multi-valued attributes. The syntax type is called '1setOf' rather than just 'setOf' as a reminder that the set  
2755 of values MUST NOT be empty (i.e., a set of size 0). Sets are normally unordered. However each attribute  
2756 description of this type may specify that the values MUST be in a certain order for that attribute.

## 2757 4.2 Job Template Attributes

2758 Job Template attributes describe job processing behavior. Support for Job Template attributes by a Printer  
2759 object is OPTIONAL (see section 12.2.3 for a description of support for OPTIONAL attributes). Also,  
2760 clients OPTIONALLY supply Job Template attributes in create requests.

2761 Job Template attributes conform to the following rules. For each Job Template attribute called "xxx":

2762 1. If the Printer object supports "xxx" then it MUST support both a "xxx-default" attribute (unless there  
2763 is a "No" in the table below) and a "xxx-supported" attribute. If the Printer object doesn't support  
2764 "xxx", then it MUST support neither an "xxx-default" attribute nor an "xxx-supported" attribute,  
2765 and it MUST treat an attribute "xxx" supplied by a client as unsupported. An attribute "xxx" may be  
2766 supported for some document formats and not supported for other document formats. For example,  
2767 it is expected that a Printer object would only support "orientation-requested" for some document  
2768 formats (such as 'text/plain' or 'text/html') but not others (such as 'application/postscript').

2769  
2770 2. "xxx" is OPTIONALLY supplied by the client in a create request. If "xxx" is supplied, the client is  
2771 indicating a desired job processing behavior for this Job. When "xxx" is not supplied, the client is  
2772 indicating that the Printer object apply its default job processing behavior at job processing time if  
2773 the document content does not contain an embedded instruction indicating an xxx-related behavior.

2774  
2775 ~~Note~~—Since an administrator MAY change the default value attribute after a Job object has been  
2776 submitted but before it has been processed, the default value used by the Printer object at job  
2777 processing time may be different that the default value in effect at job submission time.

2778

2779 3. The "xxx-supported" attribute is a Printer object attribute that describes which job processing  
2780 behaviors are supported by that Printer object. A client can query the Printer object to find out what  
2781 xxx-related behaviors are supported by inspecting the returned values of the "xxx-supported"  
2782 attribute.

2783

2784 Note: The "xxx" in each "xxx-supported" attribute name is singular, even though an "xxx-  
2785 supported" attribute usually has more than one value, such as "job-sheet-supported", unless the  
2786 "xxx" Job Template attribute is plural, such as "finishings" or "sides". In such cases the "xxx-  
2787 supported" attribute names are: "finishings-supported" and "sides-supported".

2788

2789 4. The "xxx-default" default value attribute describes what will be done at job processing time when no  
2790 other job processing information is supplied by the client (either explicitly as an IPP attribute in the  
2791 create request or implicitly as an embedded instruction within the document data).

2792

2793 If an application wishes to present an end user with a list of supported values from which to choose, the  
2794 application SHOULD query the Printer object for its supported value attributes. The application SHOULD  
2795 also query the default value attributes. If the application then limits selectable values to only those value  
2796 that are supported, the application can guarantee that the values supplied by the client in the create request  
2797 all fall within the set of supported values at the Printer. When querying the Printer, the client MAY  
2798 enumerate each attribute by name in the Get-Printer-Attributes Request, or the client MAY just name the  
2799 "job-template" group in order to get the complete set of supported attributes (both supported and default  
2800 attributes).

2801 The "finishings" attribute is an example of a Job Template attribute. It can take on a set of values such as  
2802 'staple', 'punch', and/or 'cover'. A client can query the Printer object for the "finishings-supported" attribute  
2803 and the "finishings-default" attribute. The supported attribute contains a set of supported values. The  
2804 default value attribute contains the finishing value(s) that will be used for a new Job if the client does not  
2805 supply a "finishings" attribute in the create request and the document data does not contain any  
2806 corresponding finishing instructions. If the client does supply the "finishings" attribute in the create  
2807 request, the IPP object validates the value or values to make sure that they are a subset of the supported  
2808 values identified in the Printer object's "finishings-supported" attribute. See section 3.1.7.

2809 The table below summarizes the names and relationships for all Job Template attributes. The first column  
2810 of the table (labeled "Job Attribute") shows the name and syntax for each Job Template attribute in the Job  
2811 object. These are the attributes that can optionally be supplied by the client in a create request. The last  
2812 two columns (labeled "Printer: Default Value Attribute" and "Printer: Supported Values Attribute") shows  
2813 the name and syntax for each Job Template attribute in the Printer object (the default value attribute and the  
2814 supported values attribute). A "No" in the table means the Printer MUST NOT support the attribute (that is,  
2815 the attribute is simply not applicable). For brevity in the table, the 'text' and 'name' entries do not show the  
2816 maximum length for each attribute.

2817	+	=====+	=====+	=====+

2879			

#### 2880 4.2.1 job-priority (integer(1:100))

2881 This attribute specifies a priority for scheduling the Job. A higher value specifies a higher priority. The  
 2882 value 1 indicates the lowest possible priority. The value 100 indicates the highest possible priority. Among  
 2883 those jobs that are ready to print, a Printer MUST print all jobs with a priority value of n before printing  
 2884 those with a priority value of n-1 for all n.

2885 If the Printer object supports this attribute, it MUST always support the full range from 1 to 100. No  
 2886 administrative restrictions are permitted. This way an end-user can always make full use of the entire range  
 2887 with any Printer object. If privileged jobs are implemented outside [IPP/4.0](#), [IPP/1.1](#), they MUST have  
 2888 priorities higher than 100, rather than restricting the range available to end-users.

2889 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer  
 2890 object MUST use the value of the Printer object's "job-priority-default" at job submission time (unlike most  
 2891 Job Template attributes that are used if necessary at job processing time).

2892 The syntax for the "job-priority-supported" is also integer(1:100). This single integer value indicates the  
 2893 number of priority levels supported. The Printer object MUST take the value supplied by the client and  
 2894 map it to the closest integer in a sequence of n integers values that are evenly distributed over the range  
 2895 from 1 to 100 using the formula:

$$2896 \quad \text{roundToNearestInt}((100x+50)/n)$$

2897 where n is the value of "job-priority-supported" and x ranges from 0 through n-1.

2898 For example, if n=1 the sequence of values is 50; if n=2, the sequence of values is: 25 and 75; if n = 3, the  
 2899 sequence of values is: 17, 50 and 83; if n = 10, the sequence of values is: 5, 15, 25, 35, 45, 55, 65, 75, 85,  
 2900 and 95; if n = 100, the sequence of values is: 1, 2, 3, ... 100.

2901 If the value of the Printer object's "job-priority-supported" is 10 and the client supplies values in the range 1  
 2902 to 10, the Printer object maps them to 5, in the range 11 to 20, the Printer object maps them to 15, etc.

2903 4.2.2 job-hold-until (type3 keyword | name (MAX))

2904 This attribute specifies the named time period during which the Job MUST become a candidate for printing.

2905 Standard keyword values for named time periods are:

2906 'no-hold': immediately, if there are not other reasons to hold the job

2907 'indefinite': - the job is held indefinitely, until a client performs a Release-Job (section 3.3.6)

2908 'day-time': during the day

2909 'evening': evening

2910 'night': night

2911 'weekend': weekend

2912 'second-shift': second-shift (after close of business)

2913 'third-shift': third-shift (after midnight)

2914

2915 An administrator MUST associate allowable print times with a named time period (by means outside  
2916 IPP/1.0): the scope of this IPP/1.1 document). An administrator is encouraged to pick names that suggest  
2917 the type of time period. An administrator MAY define additional values using the 'name' or 'keyword'  
2918 attribute syntax, depending on implementation.

2919 If the value of this attribute specifies a time period that is in the future, the Printer MUST SHOULD add the  
2920 'job-hold-until-specified' value to the job's "job-state-reasons" attribute, MUST move the job to the  
2921 'pending-held' state, and MUST NOT schedule the job for printing until the specified time-period arrives.

2922 When the specified time period arrives, the Printer MUST remove the 'job-hold-until-specified' value from  
2923 the job's "job-state-reason" attribute, if present. and, if there are no other job state reasons that keep the job  
2924 in the 'pending-held' state, the Printer MUST consider the job as a candidate for processing by moving the  
2925 job to the 'pending' state. **Issue 30**

2926 If this job attribute value is the named value 'no-hold', or the specified time period has already started, the  
2927 job MUST be a candidate for processing immediately.

2928 If the client does not supply this attribute and this attribute is supported by the Printer object, the Printer  
2929 object MUST use the value of the Printer object's "job-hold-until-default" at job submission time (unlike  
2930 most Job Template attributes that are used if necessary at job processing time).

2931 4.2.3 job-sheets (type3 keyword | name(MAX))

2932 This attribute determines which job start/end sheet(s), if any, MUST be printed with a job.

2933 Standard keyword values are:

2934 'none': no job sheet is printed

2935 'standard': one or more site specific standard job sheets are printed, e.g. a single start sheet or both start  
2936 and end sheet is printed

2937

2938 An administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending  
2939 on implementation.

2940 ~~Note~~: The effect of this attribute on jobs with multiple documents MAY be affected by the "multiple-  
2941 document-handling" job attribute (section 4.2.4), depending on the job sheet semantics.

#### 2942 4.2.4 multiple-document-handling (type2 keyword)

2943 This attribute is relevant only if a job consists of two or more documents. **This attribute MUST be**  
2944 **supported if the Printer supports multiple documents per job (see sections 3.2.4 and 3.3.1). Issue 34** The  
2945 attribute controls finishing operations and the placement of one or more print-stream pages into impressions  
2946 and onto media sheets. When the value of the "copies" attribute exceeds 1, it also controls the order in  
2947 which the copies that result from processing the documents are produced. For the purposes of this  
2948 explanation, if "a" represents an instance of document data, then the result of processing the data in  
2949 document "a" is a sequence of media sheets represented by "a(\*)".

2950 Standard keyword values are:

2951 'single-document': If a Job object has multiple documents, say, the document data is called a and b, then  
2952 the result of processing all the document data (a and then b) MUST be treated as a single sequence  
2953 of media sheets for finishing operations; that is, finishing would be performed on the concatenation  
2954 of the sequences a(\*),b(\*). The Printer object MUST NOT force the data in each document instance  
2955 to be formatted onto a new print-stream page, nor to start a new impression on a new media sheet. If  
2956 more than one copy is made, the ordering of the sets of media sheets resulting from processing the  
2957 document data MUST be a(\*), b(\*), a(\*), b(\*), ..., and the Printer object MUST force each copy  
2958 (a(\*),b(\*)) to start on a new media sheet.

2959 'separate-documents-uncollated-copies': If a Job object has multiple documents, say, the document data  
2960 is called a and b, then the result of processing the data in each document instance MUST be treated  
2961 as a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*) would  
2962 each be finished separately. The Printer object MUST force each copy of the result of processing the  
2963 data in a single document to start on a new media sheet. If more than one copy is made, the ordering  
2964 of the sets of media sheets resulting from processing the document data MUST be a(\*), a(\*), ...,  
2965 b(\*), b(\*) ... .

2966 'separate-documents-collated-copies': If a Job object has multiple documents, say, the document data is  
2967 called a and b, then the result of processing the data in each document instance MUST be treated as  
2968 a single sequence of media sheets for finishing operations; that is, the sets a(\*) and b(\*) would each  
2969 be finished separately. The Printer object MUST force each copy of the result of processing the data  
2970 in a single document to start on a new media sheet. If more than one copy is made, the ordering of  
2971 the sets of media sheets resulting from processing the document data MUST be a(\*), b(\*), a(\*), b(\*),  
2972 ... .

2973 'single-document-new-sheet': Same as 'single-document', except that the Printer object MUST ensure  
2974 that the first impression of each document instance in the job is placed on a new media sheet. This  
2975 value allows multiple documents to be stapled together with a single staple where each document  
2976 starts on a new sheet.

2977

2978 The 'single-document' value is the same as 'separate-documents-collated-copies' with respect to ordering of  
 2979 print-stream pages, but not media sheet generation, since 'single-document' will put the first page of the  
 2980 next document on the back side of a sheet if an odd number of pages have been produced so far for the job,  
 2981 while 'separate-documents-collated-copies' always forces the next document or document copy on to a new  
 2982 sheet. In addition, if the "finishings" attribute specifies 'staple', then with 'single-document', documents a  
 2983 and b are stapled together as a single document with no regard to new sheets, with 'single-document-new-  
 2984 sheet', documents a and b are stapled together as a single document, but document b starts on a new sheet,  
 2985 but with 'separate-documents-uncollated-copies' and 'separate-documents-collated-copies', documents a and  
 2986 b are stapled separately.

2987 Note: None of these values provide means to produce uncollated sheets within a document, i.e., where  
 2988 multiple copies of sheet n are produced before sheet n+1 of the same document.

2989 The relationship of this attribute and the other attributes that control document processing is described in  
 2990 section 15.3.

#### 2991 4.2.5 copies (integer(1:MAX))

2992 This attribute specifies the number of copies to be printed.

2993 On many devices the supported number of collated copies will be limited by the number of physical output  
 2994 bins on the device, and may be different from the number of uncollated copies which can be supported.

2995 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
 2996 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
 2997 control document processing is described in section 15.3.

#### 2998 4.2.6 finishings (1setOf type2 enum)

2999 This attribute identifies the finishing operations that the Printer uses for each copy of each printed  
 3000 document in the Job. For Jobs with multiple documents, the "multiple-document-handling" attribute  
 3001 determines what constitutes a "copy" for purposes of finishing.

3002 Standard enum values are:

3003	Value	Symbolic Name and Description
3004		
3005	'3'	'none': Perform no finishing
3006	'4'	'staple': Bind the document(s) with one or more staples. The exact number and placement of
3007		the staples is site-defined.
3008	'5'	'punch': This value indicates that holes are required in the finished document. The exact
3009		number and placement of the holes is site-defined The punch specification MAY be
3010		satisfied (in a site- and implementation-specific manner) either by drilling/punching,
3011		or by substituting pre-drilled media.

- 3012 '6' 'cover': This value is specified when it is desired to select a non-printed (or pre-printed)  
3013 cover for the document. This does not supplant the specification of a printed cover  
3014 (on cover stock medium) by the document itself.
- 3015 '7' 'bind': This value indicates that a binding is to be applied to the document; the type and  
3016 placement of the binding is site-defined."
- 3017
- 3018 '8' 'saddle-stitch': Bind the document(s) with one or more staples (wire stitches) along the  
3019 middle fold. The exact number and placement of the staples and the middle fold is  
3020 implementation and/or site-defined.
- 3021 '9' 'edge-stitch': Bind the document(s) with one or more staples (wire stitches) along one edge.  
3022 The exact number and placement of the staples is implementation and/or site-  
3023 defined.
- 3024 '10'-'19' reserved for future generic finishing enum values.
- 3025 The following values are more specific; they indicate a corner or an edge as if the document were a portrait  
3026 document (see below):
- 3027 '20' 'staple-top-left': Bind the document(s) with one or more staples in the top left corner.
- 3028 '21' 'staple-bottom-left': Bind the document(s) with one or more staples in the bottom left  
3029 corner.
- 3030 '22' 'staple-top-right': Bind the document(s) with one or more staples in the top right corner.
- 3031 '23' 'staple-bottom-right': Bind the document(s) with one or more staples in the bottom right  
3032 corner.
- 3033 '24' 'edge-stitch-left': Bind the document(s) with one or more staples (wire stitches) along the  
3034 left edge. The exact number and placement of the staples is implementation and/or  
3035 site-defined.
- 3036 '25' 'edge-stitch-top': Bind the document(s) with one or more staples (wire stitches) along the  
3037 top edge. The exact number and placement of the staples is implementation and/or  
3038 site-defined.
- 3039 '26' 'edge-stitch-right': Bind the document(s) with one or more staples (wire stitches) along the  
3040 right edge. The exact number and placement of the staples is implementation and/or  
3041 site-defined.
- 3042 '27' 'edge-stitch-bottom': Bind the document(s) with one or more staples (wire stitches) along  
3043 the bottom edge. The exact number and placement of the staples is implementation  
3044 and/or site-defined.
- 3045 '28' 'staple-dual-left': Bind the document(s) with two staples (wire stitches) along the left edge  
3046 assuming a portrait document (see above).
- 3047 '29' 'staple-dual-top': Bind the document(s) with two staples (wire stitches) along the top edge  
3048 assuming a portrait document (see above).
- 3049 '30' 'staple-dual-right': Bind the document(s) with two staples (wire stitches) along the right  
3050 edge assuming a portrait document (see above).
- 3051 '31' 'staple-dual-bottom': Bind the document(s) with two staples (wire stitches) along the bottom  
3052 edge assuming a portrait document (see above).

3053 The 'staple-xxx' values are specified with respect to the document as if the document were a portrait  
3054 document. If the document is actually a landscape or a reverse-landscape document, the client supplies the  
3055 appropriate transformed value. For example, to position a staple in the upper left hand corner of a

3056 landscape document when held for reading, the client supplies the 'staple-bottom-left' value (since  
3057 landscape is defined as a +90 degree rotation from portrait, i.e., anti-clockwise). On the other hand, to  
3058 position a staple in the upper left hand corner of a reverse-landscape document when held for reading, the  
3059 client supplies the 'staple-top-right' value (since reverse-landscape is defined as a -90 degree rotation from  
3060 portrait, i.e., clockwise).

3061 The angle (vertical, horizontal, angled) of each staple with respect to the document depends on the  
3062 implementation which may in turn depend on the value of the attribute.

3063 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3064 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3065 control document processing is described in section 15.3.

3066 If the client supplies a value of 'none' along with any other combination of values, it is the same as if only  
3067 that other combination of values had been supplied (that is the 'none' value has no effect).

#### 3068 4.2.7 page-ranges (1setOf rangeOfInteger (1:MAX))

3069 This attribute identifies the range(s) of print-stream pages that the Printer object uses for each copy of each  
3070 document which are to be printed. Nothing is printed for any pages identified that do not exist in the  
3071 document(s). Ranges MUST be in ascending order, for example: 1-3, 5-7, 15-19 and MUST NOT overlap,  
3072 so that a non-spooling Printer object can process the job in a single pass. If the ranges are not ascending or  
3073 are overlapping, the IPP object MUST reject the request and return the 'client-error-bad-request' status code.  
3074 The attribute is associated with print-stream pages not application-numbered pages (for example, the page  
3075 numbers found in the headers and or footers for certain word processing applications).

3076 For Jobs with multiple documents, the "multiple-document-handling" attribute determines what constitutes  
3077 a "copy" for purposes of the specified page range(s). When "multiple-document-handling" is 'single-  
3078 document', the Printer object MUST apply each supplied page range once to the concatenation of the print-  
3079 stream pages. For example, if there are 8 documents of 10 pages each, the page-range '41:60' prints the  
3080 pages in the 5th and 6th documents as a single document and none of the pages of the other documents are  
3081 printed. When "multiple-document-handling" is 'separate-documents-uncollated-copies' or 'separate-  
3082 documents-collated-copies', the Printer object MUST apply each supplied page range repeatedly to each  
3083 document copy. For the same job, the page-range '1:3, 10:10' would print the first 3 pages and the 10th  
3084 page of each of the 8 documents in the Job, as 8 separate documents.

3085 In most cases, the exact pages to be printed will be generated by a device driver and this attribute would not  
3086 be required. However, when printing an archived document which has already been formatted, the end user  
3087 may elect to print just a subset of the pages contained in the document. In this case, if page-range = n.m is  
3088 specified, the first page to be printed will be page n. All subsequent pages of the document will be printed  
3089 through and including page m.

3090 "page-ranges-supported" is a boolean value indicating whether or not the printer is capable of supporting  
3091 the printing of page ranges. This capability may differ from one PDL to another. There is no "page-ranges-  
3092 default" attribute. If the "page-ranges" attribute is not supplied by the client, all pages of the document will  
3093 be printed.

3094 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3095 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3096 control document processing is described in section 15.3.

#### 3097 4.2.8 sides (type2 keyword)

3098 This attribute specifies how print-stream pages are to be imposed upon the sides of an instance of a selected  
3099 medium, i.e., an impression.

3100 The standard keyword values are:

- 3101 'one-sided': imposes each consecutive print-stream page upon the same side of consecutive media  
3102 sheets.
- 3103 'two-sided-long-edge': imposes each consecutive pair of print-stream pages upon front and back sides of  
3104 consecutive media sheets, such that the orientation of each pair of print-stream pages on the medium  
3105 would be correct for the reader as if for binding on the long edge. This imposition is sometimes  
3106 called 'duplex' or 'head-to-head'.
- 3107 'two-sided-short-edge': imposes each consecutive pair of print-stream pages upon front and back sides  
3108 of consecutive media sheets, such that the orientation of each pair of print-stream pages on the  
3109 medium would be correct for the reader as if for binding on the short edge. This imposition is  
3110 sometimes called 'tumble' or 'head-to-toe'.

3111  
3112 'two-sided-long-edge', 'two-sided-short-edge', 'tumble', and 'duplex' all work the same for portrait or  
3113 landscape. However 'head-to-toe' is 'tumble' in portrait but 'duplex' in landscape. 'head-to-head' also  
3114 switches between 'duplex' and 'tumble' when using portrait and landscape modes.

3115 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3116 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3117 control document processing is described in section 15.3.

#### 3118 4.2.9 number-up (integer(1:MAX))

3119 This attribute specifies the number of print-stream pages to impose upon a single side of an instance of a  
3120 selected medium. For example, if the value is:

3121 Value	Description
3122 '1'	the Printer MUST place one print-stream page on a single side of an instance of the selected 3123 medium (MAY add some sort of translation, scaling, or rotation).
3124 '2'	the Printer MUST place two print-stream pages on a single side of an instance of the selected 3125 medium (MAY add some sort of translation, scaling, or rotation).
3126 '4'	the Printer MUST place four print-stream pages on a single side of an instance of the 3127 selected medium (MAY add some sort of translation, scaling, or rotation).

3128  
3129  
3130 This attribute primarily controls the translation, scaling and rotation of print-stream pages.

3131 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3132 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3133 control document processing is described in section 15.3.

#### 3134 4.2.10 orientation-requested (type2 enum)

3135 This attribute indicates the desired orientation for printed print-stream pages; it does not describe the  
3136 orientation of the client-supplied print-stream pages.

3137 For some document formats (such as 'application/postscript'), the desired orientation of the print-stream  
3138 pages is specified within the document data. This information is generated by a device driver prior to the  
3139 submission of the print job. Other document formats (such as 'text/plain') do not include the notion of  
3140 desired orientation within the document data. In the latter case it is possible for the Printer object to bind  
3141 the desired orientation to the document data after it has been submitted. It is expected that a Printer object  
3142 would only support "orientations-requested" for some document formats (e.g., 'text/plain' or 'text/html') but  
3143 not others (e.g., 'application/postscript'). This is no different than any other Job Template attribute since  
3144 section 4.2, item 1, points out that a Printer object may support or not support any Job Template attribute  
3145 based on the document format supplied by the client. However, a special mention is made here since it is  
3146 very likely that a Printer object will support "orientation-requested" for only a subset of the supported  
3147 document formats.

3148 Standard enum values are:

3149	Value	Symbolic Name and Description
3150		
3151	'3'	'portrait': The content will be imaged across the short edge of the medium.
3152	'4'	'landscape': The content will be imaged across the long edge of the medium. Landscape is
3153		defined to be a rotation of the print-stream page to be imaged by +90 degrees with
3154		respect to the medium (i.e. anti-clockwise) from the portrait orientation. Note: The
3155		+90 direction was chosen because simple finishing on the long edge is the same edge
3156		whether portrait or landscape
3157	'5'	'reverse-landscape': The content will be imaged across the long edge of the medium.
3158		Reverse-landscape is defined to be a rotation of the print-stream page to be imaged
3159		by -90 degrees with respect to the medium (i.e. clockwise) from the portrait
3160		orientation. Note: The 'reverse-landscape' value was added because some
3161		applications rotate landscape -90 degrees from portrait, rather than +90 degrees.
3162	'6'	'reverse-portrait': The content will be imaged across the short edge of the medium. Reverse-
3163		portrait is defined to be a rotation of the print-stream page to be imaged by 180
3164		degrees with respect to the medium from the portrait orientation. Note: The 'reverse-
3165		portrait' value was added for use with the "finishings" attribute in cases where the
3166		opposite edge is desired for finishing a portrait document on simple finishing devices
3167		that have only one finishing position. Thus a 'text/plain' portrait document can be
3168		stapled "on the right" by a simple finishing device as is common use with some
3169		middle eastern languages such as Hebrew.
3170		

3171 Note: The effect of this attribute on jobs with multiple documents is controlled by the "multiple-document-  
3172 handling" job attribute (section 4.2.4) and the relationship of this attribute and the other attributes that  
3173 control document processing is described in section 15.3.

#### 3174 4.2.11 media (type3 keyword | name(MAX))

3175 This attribute identifies the medium that the Printer uses for all impressions of the Job.

3176 The values for "media" include medium-names, medium-sizes, input-trays and electronic forms so that one  
3177 attribute specifies the media. If a Printer object supports a medium name as a value of this attribute, such a  
3178 medium name implicitly selects an input-tray that contains the specified medium. If a Printer object  
3179 supports a medium size as a value of this attribute, such a medium size implicitly selects a medium name  
3180 that in turn implicitly selects an input-tray that contains the medium with the specified size. If a Printer  
3181 object supports an input-tray as the value of this attribute, such an input-tray implicitly selects the medium  
3182 that is in that input-tray at the time the job prints. This case includes manual-feed input-trays. If a Printer  
3183 object supports an electronic form as the value of this attribute, such an electronic form implicitly selects a  
3184 medium-name that in turn implicitly selects an input-tray that contains the medium specified by the  
3185 electronic form. The electronic form also implicitly selects an image that the Printer MUST merge with the  
3186 document data as its prints each page.

3187 Standard keyword values are (taken from ISO DPA and the Printer MIB) and are listed in section 14. An  
3188 administrator MAY define additional values using the 'name' or 'keyword' attribute syntax, depending on  
3189 implementation.

3190 There is also an additional Printer attribute named "media-ready" which differs from "media-supported" in  
3191 that legal values only include the subset of "media-supported" values that are physically loaded and ready  
3192 for printing with no operator intervention required. If an IPP object supports "media-supported", it NEED  
3193 NOT support "media-ready".

3194 The relationship of this attribute and the other attributes that control document processing is described in  
3195 section 15.3.

#### 3196 4.2.12 printer-resolution (resolution)

3197 This attribute identifies the resolution that Printer uses for the Job.

#### 3198 4.2.13 print-quality (type2 enum)

3199 This attribute specifies the print quality that the Printer uses for the Job.

3200 The standard enum values are:

3201	Value	Symbolic Name and Description
3202		
3203	'3'	'draft': lowest quality available on the printer
3204	'4'	'normal': normal or intermediate quality on the printer

3205 '5' 'high': highest quality available on the printer  
3206

### 3207 4.3 Job Description Attributes

3208 The attributes in this section form the attribute group called "job-description". The following table  
3209 summarizes these attributes. The third column indicates whether the attribute is a REQUIRED attribute  
3210 that MUST be supported by Printer objects. If it is not indicated as REQUIRED, then it is OPTIONAL.  
3211 The maximum size in octets for 'text' and 'name' attributes is indicated in parentheses.

3212	+	-----+	-----+	-----+
3213		Attribute	Syntax	REQUIRED?
3214	+	-----+	-----+	-----+
3215		job-uri	uri	REQUIRED
3216	+	-----+	-----+	-----+
3217		job-id	integer(1:MAX)	REQUIRED
3218	+	-----+	-----+	-----+
3219		job-printer-uri	uri	REQUIRED
3220	+	-----+	-----+	-----+
3221		job-more-info	uri	
3222	+	-----+	-----+	-----+
3223		job-name	name (MAX)	REQUIRED
3224	+	-----+	-----+	-----+
3225		job-originating-user-name	name (MAX)	REQUIRED
3226	+	-----+	-----+	-----+
3227		job-state	type1 enum	REQUIRED
3228	+	-----+	-----+	-----+

#### 3273 [1.1.4.3.1](#) job-uri (uri)

3274 This REQUIRED attribute contains the URI for the job. The Printer object, on receipt of a new job,  
 3275 generates a URI which identifies the new Job. The Printer object returns the value of the "job-uri" attribute  
 3276 as part of the response to a create request. The precise format of a Job URI is implementation dependent.  
 3277 If the Printer object supports more than one URI and there is some relationship between the newly formed  
 3278 Job URI and the Printer object's URI, the Printer object uses the Printer URI supplied by the client in the  
 3279 create request. For example, if the create request comes in over a secure channel, the new Job URI MUST  
 3280 use the same secure channel. This can be guaranteed because the Printer object is responsible for  
 3281 generating the Job URI and the Printer object is aware of its security configuration and policy as well as the  
 3282 Printer URI used in the create request.

3283 For a description of this attribute and its relationship to "job-id" and "job-printer-uri" attribute, see the  
 3284 discussion in section 2.4 on "Object Identity".

#### 3285 [1.1.24.3.2](#) job-id (integer(1:MAX))

3286 This REQUIRED attribute contains the ID of the job. The Printer, on receipt of a new job, generates an ID  
 3287 which identifies the new Job on that Printer. The Printer returns the value of the "job-id" attribute as part of  
 3288 the response to a create request. The 0 value is not included to allow for compatibility with SNMP index  
 3289 values which also cannot be 0.

3290 For a description of this attribute and its relationship to "job-uri" and "job-printer-uri" attribute, see the  
 3291 discussion in section 2.4 on "Object Identity".

#### 3292 [1.1.34.3.3](#) job-printer-uri (uri)

3293 This REQUIRED attribute identifies the Printer object that created this Job object. When a Printer object  
 3294 creates a Job object, it populates this attribute with the Printer object URI that was used in the create  
 3295 request. This attribute permits a client to identify the Printer object that created this Job object when only  
 3296 the Job object's URI is available to the client. The client queries the creating Printer object to determine  
 3297 which languages, charsets, operations, are supported for this Job.

3298 For a description of this attribute and its relationship to "job-uri" and "job-id" attribute, see the discussion in  
 3299 section 2.4 on "Object Identity".

3300 [1.1.4.3.4](#) job-more-info (uri)

3301 Similar to "printer-more-info", this attribute contains the URI referencing some resource with more  
3302 information about this Job object, perhaps an HTML page containing information about the Job.

3303 [1.1.5.4.3.5](#) job-name (name(MAX))

3304 This REQUIRED attribute is the name of the job. It is a name that is more user friendly than the "job-uri"  
3305 attribute value. It does not need to be unique between Jobs. The Job's "job-name" attribute is set to the  
3306 value supplied by the client in the "job-name" operation attribute in the create request (see Section 3.2.1.1).  
3307 If, however, the "job-name" operation attribute is not supplied by the client in the create request, the Printer  
3308 object, on creation of the Job, MUST generate a name. The printer SHOULD generate the value of the  
3309 Job's "job-name" attribute from the first of the following sources that produces a value: 1) the "document-  
3310 name" operation attribute of the first (or only) document, 2) the "document-URI" attribute of the first (or  
3311 only) document, or 3) any other piece of Job specific and/or Document Content information.

3312 [1.1.6.4.3.6](#) job-originating-user-name (name(MAX))

3313 This REQUIRED attribute contains the name of the end user that submitted the print job. The Printer  
3314 object sets this attribute to the most authenticated printable name that it can obtain from the authentication  
3315 service over which the IPP operation was received. Only if such is not available, does the Printer object use  
3316 the value supplied by the client in the "requesting-user-name" operation attribute of the create operation  
3317 (see Section 8).

3318 Note: The Printer object needs to keep an internal originating user id of some form, typically as a credential  
3319 of a principal, with the Job object. Since such an internal attribute is implementation-dependent and not of  
3320 interest to clients, it is not specified as a Job Description attribute. This originating user id is used for  
3321 authorization checks (if any) on all subsequent operation.

3322 [1.1.7.4.3.7](#) job-state (type1 enum)

3323 This REQUIRED attribute identifies the current state of the job. Even though the IPP protocol defines  
3324 ~~eight~~seven values for job states ([plus the out-of-band 'unknown' value - see Section 4.1](#)), implementations  
3325 only need to support those states which are appropriate for the particular implementation. In other words, a  
3326 Printer supports only those job states implemented by the output device and available to the Printer object  
3327 implementation.

3328 Standard enum values are:

3329     Values     Symbolic Name and Description

3331     '3'         'pending': The job is a candidate to start processing, but is not yet processing.

3332

3333     '4'         'pending-held': The job is not a candidate for processing for any number of reasons but will  
3334                 return to the 'pending' state as soon as the reasons are no longer present. The job's

3335 "job-state-reason" attribute MUST indicate why the job is no longer a candidate for  
3336 processing.

3337  
3338 '5' 'processing': One or more of:

- 3339  
3340 1. the job is using, or is attempting to use, one or more purely software processes  
3341 that are analyzing, creating, or interpreting a PDL, etc.,  
3342 2. the job is using, or is attempting to use, one or more hardware devices that are  
3343 interpreting a PDL, making marks on a medium, and/or performing finishing, such as  
3344 stapling, etc.,  
3345 3. the Printer object has made the job ready for printing, but the output device is not  
3346 yet printing it, either because the job hasn't reached the output device or because the  
3347 job is queued in the output device or some other spooler, awaiting the output device  
3348 to print it.  
3349

3350 When the job is in the 'processing' state, the entire job state includes the detailed  
3351 status represented in the ~~printer's~~Printer object's "printer-state", "printer-state-  
3352 reasons", and "printer-state-message" attributes.

3353 Implementations MAY, though they NEED NOT, include additional values in the  
3354 job's "job-state-reasons" attribute to indicate the progress of the job, such as adding  
3355 the 'job-printing' value to indicate when the output device is actually making marks  
3356 on paper and/or the 'processing-to-stop-point' value to indicate that the IPP object is  
3357 in the process of canceling or aborting the job. Most implementations won't bother  
3358 with this nuance.  
3359

3360 '6' 'processing-stopped': The job has stopped while processing for any number of reasons and  
3361 will return to the 'processing' state as soon as the reasons are no longer present.  
3362

3363 The job's "job-state-reason" attribute MAY indicate why the job has stopped  
3364 processing. For example, if the output device is stopped, the 'printer-stopped' value  
3365 MAY be included in the job's "job-state-reasons" attribute.  
3366

3367 Note: When an output device is stopped, the device usually indicates its condition in  
3368 human readable form locally at the device. A client can obtain more complete device  
3369 status remotely by querying the Printer object's "printer-state", "printer-state-reasons"  
3370 and "printer-state-message" attributes.  
3371

3372 '7' 'canceled': The job has been canceled by a Cancel-Job operation and the Printer object has  
3373 completed canceling the job and all job status attributes have reached their final  
3374 values for the job. While the Printer object is canceling the job, the job remains in its  
3375 current state, but the job's "job-state-reasons" attribute SHOULD contain the  
3376 'processing-to-stop-point' value and one of the 'canceled-by-user', 'canceled-by-  
3377 operator', or 'canceled-at-device' value. When the job moves to the 'canceled' state,

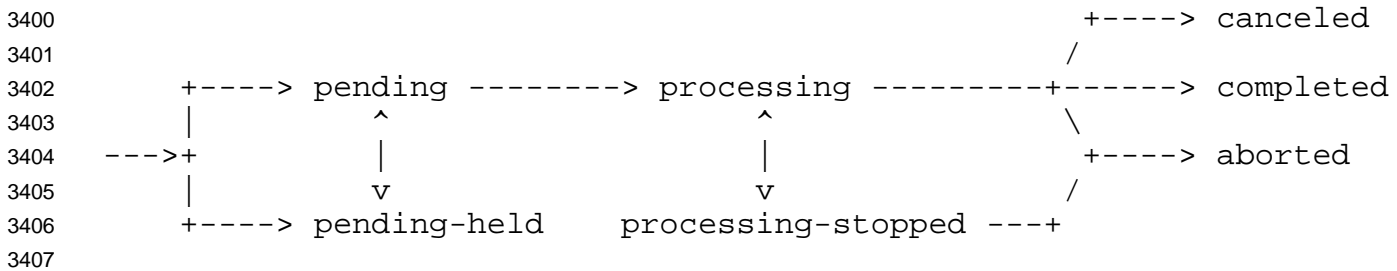

3378 the 'processing-to-stop-point' value, if present, MUST be removed, but the 'canceled-  
3379 by-xxx', if present, MUST remain.

3380  
3381 '8' 'aborted': The job has been aborted by the system, usually while the job was in the  
3382 'processing' or 'processing-stopped' state and the Printer has completed aborting the  
3383 job and all job status attributes have reached their final values for the job. While the  
3384 Printer object is aborting the job, the job remains in its current state, but the job's  
3385 "job-state-reasons" attribute SHOULD contain the 'processing-to-stop-point' and  
3386 'aborted-by-system' values. When the job moves to the 'aborted' state, the  
3387 'processing-to-stop-point' value, if present, MUST be removed, but the 'aborted-by-  
3388 system' value, if present, MUST remain.

3389  
3390 '9' 'completed': The job has completed successfully or with warnings or errors after processing  
3391 and all of the job media sheets have been successfully stacked in the appropriate  
3392 output bin(s) and all job status attributes have reached their final values for the job.  
3393 The job's "job-state-reasons" attribute SHOULD contain one of: 'completed-  
3394 successfully', 'completed-with-warnings', or 'completed-with-errors' values.

3395  
3396 The final value for this attribute MUST be one of: 'completed', 'canceled', or 'aborted' before the Printer  
3397 removes the job altogether. The length of time that jobs remain in the 'canceled', 'aborted', and 'completed'  
3398 states depends on implementation. See section 4.3.7.2.

3399 The following figure shows the normal job state transitions.

3408 Normally a job progresses from left to right. Other state transitions are unlikely, but are not forbidden. Not  
3409 shown are the transitions to the 'canceled' state from the 'pending', 'pending-held', and 'processing-stopped'  
3410 states.

3411 Jobs reach one of the three terminal states: 'completed', 'canceled', or 'aborted', after the jobs have  
3412 completed all activity, including stacking output media, after the jobs have completed all activity, and all  
3413 job status attributes have reached their final values for the job.

3414 4.3.7.1 Forwarding Servers Issue 14

3415 **Note:** As with all other IPP attributes, if the implementation can-not determine the correct value for this  
3416 attribute, it SHOULD respond with the out-of-band value 'unknown' (see section 4.1) rather than try to  
3417 guess at some possibly incorrect value and give the end user the wrong impression about the state of the Job  
3418 object. For example, if the implementation is just a gateway into some printing system ~~that does not~~

3419 provide from which it can normally get status, but temporarily is unable, then the implementation should  
3420 return the 'unknown' value. However, if the implementation is a gateway to a printing system that never  
3421 provides detailed status about the print job, the implementation MAY set the IPP Job object's state might  
3422 literally be 'unknown' to 'completed', provided that it also sets the 'queued-in-device' value in the job's "job-  
3423 state-reasons" attribute (see section 4.3.8). Issue 14

#### 3424 4.3.7.2 Partitioning of Job States

3425 This section partitions the 7 job states into phases: Job Not Completed, Job Retention, Job History, and Job  
3426 Removal. This section also explains the 'job-restartable' value of the "job-state-reasons" Job Description  
3427 attribute for use with the Restart-Job operation.

3428 Job Not Completed: When a job is in the 'pending', 'pending-held', 'processing', or 'processing-stopped'  
3429 states, the job is not completed.

3430 Job Retention: When a job enters one of the three terminal job states: 'completed', 'canceled', or 'aborted',  
3431 the IPP Printer object MAY "retain" the job in a restartable condition for an implementation-defined time  
3432 period. This time period MAY be zero seconds and MAY depend on the terminal job state. This phase is  
3433 called Job Retention. While in the Job Retention phase, the job's document data is retained and a client  
3434 may restart the job using the Restart-Job operation. If the IPP object supports Issue 30 the Restart-Job  
3435 operation, then it SHOULD indicate that the job is restartable by adding the 'job-restartable' value to the  
3436 job's "job-state-reasons" attribute (see Section 4.3.8) during the Job Retention phase.

3437 Job History: After the Job Retention phase expires for a job, the Printer object deletes the document data  
3438 for the job and the job becomes part of the Job History. The Printer object MAY also delete any number of  
3439 the job attributes. Since the job is no longer restartable, the Printer object MUST remove the 'job-  
3440 restartable' value from the job's "job-state-reasons" attribute, if present.

3441 Job Removal: After the job has remained in the Job History for an implementation-defined time, such as  
3442 when the number of jobs exceeds a fixed number or after a fixed time period (which MAY be zero  
3443 seconds), the IPP Printer removes the job from the system.

3444 Using the Get-Jobs operation and supplying the 'not-completed' value for the "which-jobs" operation  
3445 attribute, a client is requesting jobs in the Job Not Completed phase. Using the Get-Jobs operation and  
3446 supplying the 'completed' value for the "which-jobs" operation attribute, a client is requesting jobs in the  
3447 Job Retention and Job History phases. Using the Get-Job-Attributes operation, a client is requesting a job  
3448 in any phase except Job Removal. After Job Removal, the Get-Job-Attributes and Get-Jobs operations no  
3449 longer are capable of returning any information about a job.

#### 3450 4.3.8 job-state-reasons (1setOf type2 keyword)

3451 This REQUIRED attribute provides additional information about the job's current state, i.e., information  
3452 that augments the value of the job's "job-state" attribute.

3453 ~~Implementation of these values is OPTIONAL, i.e., a Printer NEED NOT implement them, even if (1) the~~  
3454 ~~output device supports the functionality represented by the reason and (2) is available to the Printer object~~  
3455 ~~implementation.~~ These values MAY be used with any job state or states for which the reason makes sense.

3456 Some of these value definitions indicate conformance requirements; the rest are OPTIONAL. Issue 30  
3457 Furthermore, when implemented, the Printer MUST return these values when the reason applies and MUST  
3458 NOT return them when the reason no longer applies whether the value of the Job's "job-state" attribute  
3459 changed or not. When the Job does not have any reasons for being in its current state, the value of the  
3460 Job's "~~job-state~~ "job-state-reasons" attribute MUST be 'none'.

3461 Note: While values cannot be added to the 'job-state' attribute without impacting deployed clients that take  
3462 actions upon receiving "job-state" values, it is the intent that additional "job-state-reasons" values can be  
3463 defined and registered without impacting such deployed clients. In other words, the "job-state-reasons"  
3464 attribute is intended to be extensible.

3465 The following standard keyword values are defined. For ease of understanding, the values are presented in  
3466 the order in which the reasons are likely to occur (if implemented), starting with the 'job-incoming' value:

3467 'none': There are no reasons for the job's current state. This state reason is semantically equivalent to  
3468 "job-state-reasons" without any value and MUST be used when there is no other value, since the  
3469 1setOf attribute syntax requires at least one value. Issue 30

3470 'job-incoming': The Create-Job operation has been accepted by the Printer, but the Printer is expecting  
3471 additional Send-Document and/or Send-URI operations and/or is accessing/accepting document  
3472 data.

3473 'job-data-insufficient': The Create-Job operation has been accepted by the Printer, but the Printer is  
3474 expecting additional document data before it can move the job into the 'processing' state. If a Printer  
3475 starts processing before it has received all data, the Printer removes the 'job-data-insufficient'  
3476 reason, but the 'job-incoming' remains. If a Printer starts processing after it has received all data, the  
3477 Printer removes the 'job-data-insufficient' reason and the 'job-incoming' at the same time. Issue 13

3478 'document-access-error': After accepting a Print-URI or Send-URI request, the Printer could not access  
3479 one or more documents passed by reference. This reason is intended to cover any file access  
3480 problem, including file does not exist and access denied because of an access control problem. The  
3481 Printer MAY also indicate the document access error using the "job-document-access-errors" Job  
3482 Description attribute (see section 4.3.11). Whether the Printer aborts the job and moves the job to  
3483 the 'aborted' job state or prints all documents that are accessible and moves the job to the 'completed'  
3484 job state and adds the 'completed-with-errors' value in the job's "job-state-reasons" attribute depends  
3485 on implementation and/or site policy. This value SHOULD be supported if the Print-URI or Send-  
3486 URI operations are supported. Issue 30 and Issue 35

3487 'submission-interrupted': The job was not completely submitted for some unforeseen reason, such as:  
3488 (1) the Printer has crashed before the job was closed by the client, (2) the Printer or the document  
3489 transfer method has crashed in some non-recoverable way before the document data was entirely  
3490 transferred to the Printer, (3) the client crashed or failed to close the job before the time-out period.  
3491 See section 4.4.31.

3492 'job-outgoing': The Printer is transmitting the job to the output device.

3493 'job-hold-until-specified': The value of the job's "job-hold-until" attribute was specified with a time  
3494 period that is still in the future. The job MUST NOT be a candidate for processing until this reason  
3495 is removed and there are no other reasons to hold the job. This value MUST-SHOULD be  
3496 supported if the "job-hold-until" Job Template attribute is supported. Issue 30

3497 'resources-are-not-ready': At least one of the resources needed by the job, such as media, fonts, resource  
3498 objects, etc., is not ready on any of the physical printer's for which the job is a candidate. This

- 3499 condition MAY be detected when the job is accepted, or subsequently while the job is pending or  
3500 processing, depending on implementation. The job may remain in its current state or be moved to  
3501 the 'pending-held' state, depending on implementation and/or job scheduling policy.
- 3502 'printer-stopped-partly': The value of the Printer's "printer-state-reasons" attribute contains the value  
3503 'stopped-partly'.
- 3504 'printer-stopped': The value of the Printer's "printer-state" attribute is 'stopped'.
- 3505 'job-interpreting': Job is in the 'processing' state, but more specifically, the Printer is interpreting the  
3506 document data.
- 3507 'job-queued': Job is in the 'processing' state, but more specifically, the Printer has queued the document  
3508 data.
- 3509 'job-transforming': Job is in the 'processing' state, but more specifically, the Printer is interpreting  
3510 document data and producing another electronic representation.
- 3511 'job-queued-for-marker': Job is in any of the 'pending-held', 'pending', or 'processing' states, but more  
3512 specifically, the Printer has completed enough processing of the document to be able to start  
3513 marking and the job is waiting for the marker. Systems that require human intervention to release  
3514 jobs using the Release-Job operation, put the job into the 'pending-held' job state. Systems that  
3515 automatically select a job to use the marker put the job into the 'pending' job state or keep the job in  
3516 the 'processing' job state while waiting for the marker, depending on implementation. All  
3517 implementations put the job into (or back into) the 'processing' state when marking does begin.  
3518 **Issue 31**
- 3519 'job-printing': The output device is marking media. This value is useful for Printers which spend a great  
3520 deal of time processing (1) when no marking is happening and then want to show that marking is  
3521 now happening or (2) when the job is in the process of being canceled or aborted while the job  
3522 remains in the 'processing' state, but the marking has not yet stopped so that impression or sheet  
3523 counts are still increasing for the job.
- 3524 'job-canceled-by-user': The job was canceled by the owner of the job using the Cancel-Job request, i.e.,  
3525 by a user whose authenticated identity is the same as the value of the originating user that created  
3526 the Job object, or by some other authorized end-user, such as a member of the job owner's security  
3527 group. This value SHOULD be supported. **Issue 30**
- 3528 'job-canceled-by-operator': The job was canceled by the operator using the Cancel-Job request, i.e., by a  
3529 user who has been authenticated as having operator privileges (whether local or remote). If the  
3530 security policy is to allow anyone to cancel anyone's job, then this value may be used when the job  
3531 is canceled by other than the owner of the job. For such a security policy, in effect, everyone is an  
3532 operator as far as canceling jobs with IPP is concerned. This value SHOULD be supported if the  
3533 implementation permits canceling by other than the owner of the job. **Issue 30**
- 3534 'job-canceled-at-device': The job was canceled by an unidentified local user, i.e., a user at a console at  
3535 the device. This value SHOULD be supported if the implementation supports canceling jobs at the  
3536 console. **Issue 30**
- 3537 'aborted-by-system': The job (1) is in the process of being aborted, (2) has been aborted by the system  
3538 and placed in the 'aborted' state, or (3) has been aborted by the system and placed in the 'pending-  
3539 held' state, so that a user or operator can manually try the job again. This value SHOULD be  
3540 supported. **Issue 30**
- 3541 'unsupported-compression': The job was aborted by the system because the Printer determined while  
3542 attempting to decompress the document-data's that the compression is actually not among those

3543 supported by the Printer. This value MUST be supported, since "compressions is a REQUIRED  
3544 operation attribute. Issue 6

3545 'compression-error': The job was aborted by the system because the Printer encountered an error in the  
3546 document-data while decompressing it. If the Printer posts this reason, the document-data has  
3547 already passed any tests that would have led to the 'unsupported-compression' job-state-reason. Issue  
3548 6

3549 'unsupported-document-format': The job was aborted by the system because the document-data's  
3550 document-format is not among those supported by the Printer. If the client specifies the document-  
3551 format as 'application/octet-stream', the printer MAY abort the job and post this reason even though  
3552 the format is a member of the "document-format-supported" printer attribute, but not among the  
3553 auto-sensed document-formats. This value MUST be supported, since "document-format" is a  
3554 REQUIRED operation attribute. Issue 3

3555 'document-format-error': The job was aborted by the system because the Printer encountered an error in  
3556 the document-data while processing it. If the Printer posts this reason, the document-data has  
3557 already passed any tests that would have led to the 'unsupported-document-format' job-state-reason.  
3558 Issue 3

3559 'processing-to-stop-point': The requester has issued a ~~Cancel-job~~Cancel-Job operation or the Printer  
3560 object has aborted the job, but is still performing some actions on the job until a specified stop point  
3561 occurs or job termination/cleanup is completed.

3562 If the implementation requires some measurable time to cancel the job in the 'processing' or  
3563 'processing-stopped' job states, the IPP object MUST use this value This reason is- Issue 30  
3564 RECOMMENDED to be used in conjunction with the 'processing' job state to indicate that the  
3565 Printer object is still performing some actions on the job while the job remains in the 'processing' or  
3566 'processing-stopped' state. After all the job's job description attributes have stopped incrementing,  
3567 the Printer object moves the job from the 'processing' state to the 'canceled' or 'aborted' job states.

3568 'service-off-line': The Printer is off-line and accepting no jobs. All 'pending' jobs are put into the  
3569 'pending-held' state. This situation could be true if the service's or document transform's input is  
3570 impaired or broken.

3571 'job-completed-successfully': The job completed successfully. This value SHOULD be supported.  
3572 Issue 30

3573 'job-completed-with-warnings': The job completed with warnings. This value SHOULD be supported  
3574 if the implementation detects warnings. Issue 30

3575 'job-completed-with-errors': The job completed with errors (and possibly warnings too). This value  
3576 SHOULD be supported if the implementation detects errors. Issue 30

3577 'job-restartable' - This job is retained (see section 4.3.7.2) and is currently able to be restarted using the  
3578 Restart-Job operation (see section 3.3.7). If 'job-restartable' is a value of the job's 'job-state-reasons'  
3579 attribute, then the IPP object MUST accept a Restart-Job operation for that job. This value  
3580 SHOULD be supported if the Restart-Job operation is supported. Issue 30

3581 'queued-in-device': The job has been forwarded to a device or print system that is unable to send back  
3582 status. The Printer sets the job's "job-state" attribute to 'completed' and adds the 'queued-in-device'  
3583 value to the job's "job-state-reasons" attribute to indicate that the Printer has no additional  
3584 information about the job and never will have any better information. See section 4.3.7.1. Issue 14

3585 ~~4.3.9~~4.3.9 job-state-message (text(MAX))

3586 This attribute specifies information about the "job-state" and "job-state-reasons" attributes in human  
3587 readable text. If the Printer object supports this attribute, the Printer object MUST be able to generate this  
3588 message in any of the natural languages identified by the Printer's "generated-natural-language-supported"  
3589 attribute (see the "attributes-natural-language" operation attribute specified in Section 3.1.4.1).

3590 ~~Note:~~The value SHOULD NOT contain additional information not contained in the values of the "job-  
3591 state" and "job-states-reasons" attributes, such as interpreter error information. Otherwise, application  
3592 programs might attempt to parse the (localized text). For such additional information such as interpreter  
3593 errors for application program ~~consumption, a new attribute~~consumption or specific document access  
3594 errors, new attributes with keyword values, needs to be developed and registered.

3595 4.3.10 job-detailed-status-messages (1setOf text(MAX)) Issue 35

3596 This attribute specifies additional detailed and technical information about the job. Neither the Printer nor  
3597 the client localizes the message(s), since they are intended for use by the system administrator or other  
3598 experienced technical persons. Clients MUST NOT attempt to parse the value of this attribute. See "job-  
3599 document-access-errors" (section 4.3.11) for additional errors that a program can process.

3600 4.3.11 job-document-access-errors (1setOf text(MAX)) Issue 35

3601 This attribute provides additional information about each document access error for this job encountered by  
3602 the Printer after it returned a response to the Print-URI or Send-URI operation and subsequently attempted  
3603 to access document(s) supplied in the Print-URI or Send-URI operation. For errors in the protocol that is  
3604 identified by the URI scheme in the "document-uri" operation attribute, such as 'http:' or 'ftp:', the error code  
3605 is returned in parentheses, followed by the URI. For example:

3606 (404) http://ftp.pwg.org/pub/pwg/ipp/new\_MOD/ipp-model-v11-990510.pdf

3607  
3608 Most Internet protocols use decimal error codes (unlike IPP), so the ASCII error code representation is in  
3609 decimal.

3610 ~~4.3.12~~4.3.12 number-of-documents (integer(0:MAX))

3611 This attribute indicates the number of documents in the job, i.e., the number of Send-Document, Send-URI,  
3612 Print-Job, or Print-URI operations that the Printer has accepted for this job, regardless of whether the  
3613 document data has reached the Printer object or not.

3614 Implementations supporting the OPTIONAL Create-Job/Send-Document/Send-URI operations SHOULD  
3615 support this attribute so that clients can query the number of documents in each job.

3616 ~~4.3.13~~4.3.13 output-device-assigned (name(127))

3617 This attribute identifies the output device to which the Printer object has assigned this job. If an output  
3618 device implements an embedded Printer object, the Printer object NEED NOT set this attribute. If a print  
3619 server implements a Printer object, the value MAY be empty (zero-length string) or not returned until the

3620 Printer object assigns an output device to the job. This attribute is particularly useful when a single Printer  
3621 object support multiple devices (so called "fan-out").

#### 3622 4.3.14 Event Time Job Description Attributes Issue 17

3623 This section defines the Job Description attributes that indicate the time at which certain events occur for a  
3624 job. If the job event has not yet occurred, then the IPP object MUST return the 'no-value' out-of-band value  
3625 (see the beginning of Section 4.1). The "time-at-xxx(integer)" attributes represent time as an 'integer'  
3626 representing the number of seconds since the device was powered up (informally called "time ticks"). The  
3627 "date-time-at-xxx(dateTime)" attributes represent time as 'dateTime' representing date and time (including  
3628 an offset from UTC).

3629 In order to populate these attributes, the Printer object copies the value(s) of the following Printer  
3630 Description attributes at the time the event occurs:

- 3631 1. the value in the Printer's "printer-up-time" attribute for the "time-at-xxx(integer)" attributes
- 3632 2. the value in the Printer's "printer-current-time" attribute for the "date-time-at-xxx(dateTime)"  
3633 attributes.

3634 If the Printer resets its "printer-up-time" attribute to 1 on power-up (see section 4.4.29) and has persistent  
3635 jobs, then it MUST change all of jobs' "time-at-xxx(integer)" (time tick) job attributes whose events have  
3636 occurred either to:

- 3637 1. 0 to indicate that the event happened before the most recent power up OR
- 3638 2. the negative of the number of seconds before the most recent power-up that the event took place,  
3639 though the negative number NEED NOT reflect the exact number of seconds.

3640 If a client queries a "time-at-xxx(integer)" time tick Job attribute and finds the value to be 0 or negative, the  
3641 client MUST assume that the event occurred in some life other than the Printer's current life.

3642 Note: A Printer does not change the values of any "date-time-at-xxx(dateTime)" job attributes on power-up.

##### 3643 4.3.14.1 time-at-creation (integer(MIN:MAX))

3644 This **REQUIRED** attribute indicates the ~~point in~~ time at which the Job object was created. ~~In order to~~  
3645 ~~populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the Job~~  
3646 ~~object is created.~~

##### 3647 4.3.14.2 time-at-processing (integer(MIN:MAX))

3648 This **REQUIRED** attribute indicates the ~~point in~~ time at which the Job object **first** began processing after the  
3649 create operation or the most recent Restart-Job operation. The out-of-band 'no-value' value is returned if  
3650 the job has not yet been in the 'processing' state (see the beginning of Section 4.1). Issue 17 ~~In order to~~

3651 ~~populate this attribute, the Printer object uses the value in its "printer-up-time" attribute at the time the Job~~  
3652 ~~object is moved into the 'processing' state for the first time.~~

3653 4.3.14.3 time-at-completed (integer(MIN:MAX))

3654 This **REQUIRED** attribute indicates the ~~point in~~ time at which the Job object completed (or was cancelled  
3655 or aborted). The out-of-band 'no-value' value is returned if the job has not yet completed, been canceled, or  
3656 aborted (see the beginning of Section 4.1).

3657 4.3.14.4 job-printer-up-time (integer(1:MAX)) Issue 17

3658 This REQUIRED Job Description attribute indicates the amount of time (in seconds) that the Printer  
3659 implementation has been up and running. This attribute is an alias for the "printer-up-time" Printer  
3660 Description attribute (see Section 4.4.29).

3661 A client MAY request this attribute in a Get-Job-Attributes or Get-Jobs request and use the value returned  
3662 in combination with other requested Event Time Job Description Attributes in order to display time  
3663 attributes to a user. The difference between this attribute and the 'integer' value of a "time-at-xxx" attribute  
3664 is the number of seconds ago that the "time-at-xxx" event occurred. A client can compute the wall-clock  
3665 time at which the "time-at-xxx" event occurred by subtracting this difference from the client's wall-clock  
3666 time.

3667 4.3.14.5 date-time-at-creation (dateTime) Issue 17

3668 This attribute indicates the date and time at which the Job object was created.

3669 4.3.14.6 date-time-at-processing (dateTime) Issue 17

3670 This attribute indicates the date and time at which the Job object first began processing after the create  
3671 operation or the most recent Restart-Job operation.

3672 4.3.14.7 date-time-at-completed (dateTime) Issue 17

3673 This attribute indicates the date and time at which the Job object completed (or was cancelled or aborted).

3674 4.3.15 number-of-intervening-jobs (integer(0:MAX))

3675 This attribute indicates the number of jobs that are "ahead" of this job in the relative chronological order of  
3676 expected time to complete (i.e., the current scheduled order). For efficiency, it is only necessary to calculate  
3677 this value when an operation is performed that requests this attribute.

3678 4.3.16 job-message-from-operator (text(127))

3679 This attribute provides a message from an operator, system administrator or "intelligent" process to indicate  
3680 to the end user the reasons for modification or other management action taken on a job.

## 3681 4.3.17 Job Size Attributes

3682 This sub-section defines job attributes that describe the size of the job. These attributes are not intended to  
3683 be counters; they are intended to be useful routing and scheduling information if known. For these  
3684 attributes, the Printer object may try to compute the value if it is not supplied in the create request. Even if  
3685 the client does supply a value for these three attributes in the create request, the Printer object MAY choose  
3686 to change the value if the Printer object is able to compute a value which is more accurate than the client  
3687 supplied value. The Printer object may be able to determine the correct value for these attributes either  
3688 right at job submission time or at any later point in time.

## 3689 4.3.17.1 job-k-octets (integer(0:MAX))

3690 This attribute specifies the total size of the document(s) in K octets, i.e., in units of 1024 octets requested to  
3691 be processed in the job. The value MUST be rounded up, so that a job between 1 and 1024 octets MUST  
3692 be indicated as being 1, 1025 to 2048 MUST be 2, etc.

3693 This value MUST NOT include the multiplicative factors contributed by the number of copies specified by  
3694 the "copies" attribute, independent of whether the device can process multiple copies without making  
3695 multiple passes over the job or document data and independent of whether the output is collated or not.  
3696 Thus the value is independent of the implementation and indicates the size of the document(s) measured in  
3697 K octets independent of the number of copies.

3698 This value MUST also not include the multiplicative factor due to a copies instruction embedded in the  
3699 document data. If the document data actually includes replications of the document data, this value will  
3700 include such replication. In other words, this value is always the size of the source document data, rather  
3701 than a measure of the hardcopy output to be produced.

3702 ~~Note: This attribute and the following two attributes ("job-impressions" and "job-media-sheets") are not~~  
3703 ~~intended to be counters; they are intended to be useful routing and scheduling information if known. For~~  
3704 ~~these three attributes, the Printer object may try to compute the value if it is not supplied in the create~~  
3705 ~~request. Even if the client does supply a value for these three attributes in the create request, the Printer~~  
3706 ~~object MAY choose to change the value if the Printer object is able to compute a value which is more~~  
3707 ~~accurate than the client supplied value. The Printer object may be able to determine the correct value for~~  
3708 ~~these three attributes either right at job submission time or at any later point in time.~~

## 3709 4.3.17.2 job-impressions (integer(0:MAX))

3710 This attribute specifies the total size in number of impressions of the document(s) being submitted (see the  
3711 definition of impression in section 12.2.5).

3712 As with "job-k-octets", this value MUST NOT include the multiplicative factors contributed by the number  
3713 of copies specified by the "copies" attribute, independent of whether the device can process multiple copies  
3714 without making multiple passes over the job or document data and independent of whether the output is  
3715 collated or not. Thus the value is independent of the implementation and reflects the size of the  
3716 document(s) measured in impressions independent of the number of copies.

3717 As with "job-k-octets", this value MUST also not include the multiplicative factor due to a copies  
3718 instruction embedded in the document data. If the document data actually includes replications of the  
3719 document data, this value will include such replication. In other words, this value is always the number of  
3720 impressions in the source document data, rather than a measure of the number of impressions to be  
3721 produced by the job.

3722 ~~See the Note in the "job-k-octets" attribute that also applies to this attribute.~~

#### 3723 4.3.17.3 job-media-sheets (integer(0:MAX))

3724 This attribute specifies the total number of media sheets to be produced for this job.

3725 Unlike the "job-k-octets" and the "job-impressions" attributes, this value MUST include the multiplicative  
3726 factors contributed by the number of copies specified by the "copies" attribute and a 'number of copies'  
3727 instruction embedded in the document data, if any. This difference allows the system administrator to  
3728 control the lower and upper bounds of both (1) the size of the document(s) with "job-k-octets-supported"  
3729 and "job-impressions-supported" and (2) the size of the job with "job-media-sheets-supported".

3730 ~~See the Note in the "job-k-octets" attribute that also applies to this attribute.~~

#### 3731 4.3.18 Job Progress Attributes

3732 This sub-section defines job attributes that describe the progress of the job. These attributes are intended to  
3733 be counters. That is, the value for a job that has not started processing MUST be 0. When the job's "job-  
3734 state" is 'processing' or 'processing-stopped', this value is intended to contain the amount of the job that has  
3735 been processed to the time at which the attributes are requested. When the job enters the 'completed',  
3736 'canceled', or 'aborted' states, these values are the final values for the job.

##### 3737 4.3.18.1 job-k-octets-processed (integer(0:MAX))

3738 This attribute specifies the total number of octets processed in K octets, i.e., in units of 1024 octets so far.  
3739 The value MUST be rounded up, so that a job between 1 and 1024 octets inclusive MUST be indicated as  
3740 being 1, 1025 to 2048 inclusive MUST be 2, etc.

3741 For implementations where multiple copies are produced by the interpreter with only a single pass over the  
3742 data, the final value MUST be equal to the value of the "job-k-octets" attribute. For implementations where  
3743 multiple copies are produced by the interpreter by processing the data for each copy, the final value MUST  
3744 be a multiple of the value of the "job-k-octets" attribute.

3745 ~~Note: This attribute and the following two attributes ("job-impressions-completed" and "job-sheets-~~  
3746 ~~completed") are intended to be counters. That is, the value for a job that has not started processing MUST~~  
3747 ~~be 0. When the job's "job-state" is 'processing' or 'processing-stopped', this value is intended to contain the~~  
3748 ~~amount of the job that has been processed to the time at which the attributes are requested.~~

## 3749 4.3.18.2 job-impressions-completed (integer(0:MAX))

3750 This job attribute specifies the number of impressions completed for the job so far. For printing devices,  
3751 the impressions completed includes interpreting, marking, and stacking the output.

3752 ~~See the note in "job-k octets processed" which also applies to this attribute.~~

## 3753 4.3.18.3 job-media-sheets-completed (integer(0:MAX))

3754 This job attribute specifies the media-sheets completed marking and stacking for the entire job so far  
3755 whether those sheets have been processed on one side or on both.

3756 ~~See the note in "job-k octets processed" which also applies to this attribute.~~

## 3757 4.3.19 attributes-charset (charset)

3758 This REQUIRED attribute is populated using the value in the client supplied "attributes-charset" attribute in  
3759 the create request. It identifies the charset (coded character set and encoding method) used by any Job  
3760 attributes with attribute syntax 'text' and 'name' that were supplied by the client in the create request. See  
3761 Section 3.1.4 for a complete description of the "attributes-charset" operation attribute.

3762 This attribute does not indicate the charset in which the 'text' and 'name' values are stored internally in the  
3763 Job object. The internal charset is implementation-defined. The IPP object MUST convert from whatever  
3764 the internal charset is to that being requested in an operation as specified in Section 3.1.4.

## 3765 4.3.20 attributes-natural-language (naturalLanguage)

3766 This REQUIRED attribute is populated using the value in the client supplied "attributes-natural-language"  
3767 attribute in the create request. It identifies the natural language used for any Job attributes with attribute  
3768 syntax 'text' and 'name' that were supplied by the client in the create request. See Section 3.1.4 for a  
3769 complete description of the "attributes-natural-language" operation attribute. See Sections 4.1.1.2 and  
3770 4.1.2.2 for how a Natural Language Override may be supplied explicitly for each 'text' and 'name' attribute  
3771 value that differs from the value identified by the "attributes-natural-language" attribute.

## 3772 4.4 Printer Description Attributes

3773 These attributes form the attribute group called "printer-description". The following table summarizes  
3774 these attributes, their syntax, and whether or not they are REQUIRED for a Printer object to support. If  
3775 they are not indicated as REQUIRED, they are OPTIONAL. The maximum size in octets for 'text' and  
3776 'name' attributes is indicated in parentheses.

3777 Note: How these attributes are set by an Administrator is outside the scope of this [specification-IPP/1.1](#)  
3778 [document](#).

3863	

#### 3864 4.4.1 printer-uri-supported (1setOf uri)

3865 This REQUIRED Printer attribute contains at least one URI for the Printer object. It OPTIONALLY  
 3866 contains more than one URI for the Printer object. An administrator determines a Printer object's URI(s)  
 3867 and configures this attribute to contain those URIs by some means outside the scope of ~~IPP/1.0~~this IPP/1.1  
 3868 document. The precise format of this URI is implementation dependent and depends on the protocol. See  
 3869 the next ~~section~~two sections for a description of the "uri-security-supported" and "uri-authentication-  
 3870 supported" attributes, both of which ~~is~~are the REQUIRED companion attributes to this "printer-uri-  
 3871 supported" attribute. See section 2.4 on Printer object identity and section 8.2 on security and URIs for  
 3872 more information.

3873 4.4.2 uri-authentication-supported (1setOf type2 keyword) Issue 2

3874 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as  
3875 the "printer-uri-supported" attribute. This attribute identifies the Client Authentication mechanism  
3876 associated with each URI listed in the "printer-uri-supported" attribute. The Printer object uses the specified  
3877 mechanism to identify the authenticated user (see section 8.3). The "i th" value in "uri-authentication-  
3878 supported" corresponds to the "i th" value in "printer-uri-supported" and it describes the authentication  
3879 mechanisms used by the Printer when accessed via that URI. See [IPP-PRO] for more details on Client  
3880 Authentication.

3881 The following standard keyword values are defined:

3882 'none': There is no authentication mechanism associated with the URI. The Printer object assumes that  
3883 the authenticated user is "anonymous".  
3884 'requesting-user-name': When a client performs an operation whose target is the associated URI, the  
3885 Printer object assumes that the authenticated user is specified by the "requesting-user-name"  
3886 Operation attribute (see section 8.3). If the "requesting-user-name" attribute is absent in a request,  
3887 the Printer object assumes that the authenticated user is "anonymous".  
3888 'basic': When a client performs an operation whose target is the associated URI, the Printer object  
3889 challenges the client with HTTP basic authentication. The Printer object assumes that the  
3890 authenticated user is the name received via the basic authentication mechanism.  
3891 'digest': When a client performs an operation whose target is the associated URI, the Printer object  
3892 challenges the client with HTTP digest authentication. The Printer object assumes that the  
3893 authenticated user is the name received via the digest authentication mechanism.  
3894 'certificate': When a client performs an operation whose target is the associated URI, the Printer object  
3895 expects the client to provide a certificate. The Printer object assumes that the authenticated user is  
3896 the textual name contained within the certificate.

3897 4.4.3 uri-security-supported (1setOf type2 keyword)

3898 This REQUIRED Printer attribute MUST have the same cardinality (contain the same number of values) as  
3899 the "printer-uri-supported" attribute. This attribute identifies the security mechanisms used for each URI  
3900 listed in the "printer-uri-supported" attribute. The "i th" value in "uri-security-supported" corresponds to  
3901 the "i th" value in "printer-uri-supported" and it describes the security mechanisms used for accessing the  
3902 Printer object via that URI. See [IPP-PRO] for more details on security mechanisms.

3903 The following standard keyword values are defined:

3904 'none': There are no secure communication channel protocols in use for the given URI.  
3905 'ssl3': SSL3 [SSL] is the secure communications channel protocol in use for the given URI.  
3906 'tls': TLS [RFC2246] is the secure communications channel protocol in use for the given URI.

3908 This attribute is orthogonal to the definition of a Client Authentication mechanism. Specifically, 'none'  
3909 does not exclude Client Authentication. See section 4.4.2. Issue 21

3910 Consider the following example. For a single Printer object, an administrator configures the "printer-uri-  
3911 supported", "uri-authentication-supported" and "uri-security-supported" attributes as follows:

3912 "printer-uri-supported": <httpxxx://acme.com/open-use-printer>, [httpxxx://acme.com/restricted-use-](httpxxx://acme.com/restricted-use-printer)  
3913 printer', <httpxxx://acme.com/private-printer>'  
3914 "uri-authentication-supported": 'none', 'digest', 'basic'  
3915 "uri-security-supported": 'none', 'none', 'ssl3-tls'  
3916

3917 Note: 'xxx' is not a valid scheme. See the IPP/1.1 "Transport and Encoding" document [IPP-PRO] for the  
3918 actual URI schemes to be used in object target attributes.

3919 In this case, one Printer object has three URIs.

- 3920 - For the first URI, <httpxxx://acme.com/open-use-printer>', the value 'none' in "uri-security-supported"  
3921 indicates that there is no secure channel protocol configured to run under HTTP. The name implies  
3922 that there is no Basic or Digest authentication being used, but it is up to the client to determine that  
3923 while using HTTP value of 'none' in "uri-authentication-supported" indicates that all users are  
3924 'anonymous'. There will be no challenge and the Printer will ignore underneath the IPP application  
3925 protocol. "requesting-user-name".  
3926 - For the second URI, <httpxxx://acme.com/restricted-use-printer>', the value 'none' in "uri-security-  
3927 supported" indicates that there is no secure channel protocol configured to run under HTTP. In this  
3928 case, although the name does imply that there is some sort of Basic or Digest authentication being  
3929 used within HTTP, it is up to the The value of 'digest' in "uri-authentication-supported" indicates that  
3930 the Printer will issue a challenge and that the Printer will use the name client to determine that while  
3931 using HTTP and by processing any '401 Unauthorized' HTTP error messages: supplied by the digest  
3932 mechanism to determine the authenticated user (see section 8.3).  
3933 - For the third URI, <httpxxx://acme.com/private-printer>', the value 'ssl3-tls' in "uri-security-supported"  
3934 indicates that SSL3TLS is being used to secure the channel. The client SHOULD be prepared to use  
3935 SSL3TLS framing to negotiate an acceptable ciphersuite to use while communicating with the  
3936 Printer object. In this case, the name implies the use of a secure communications channel, but the  
3937 fact is made explicit by the presence of the 'ssl3-tls' value in "uri-security-supported". The client  
3938 does not need to resort to understanding which security it must use by following naming  
3939 conventions or by parsing the URI to determine which security mechanisms are implied.  
3940 implied. The value of 'basic' in "uri-authentication-supported" indicates that the Printer will issue a  
3941 challenge and that the Printer will use the name supplied by the digest mechanism to determine the  
3942 authenticated user (see section 8.3) . Because this challenge occurs in a tls session, the channel is  
3943 secure.  
3944

3945 It is expected that many IPP Printer objects will be configured to support only one channel (either  
3946 configured to use SSL3 access or not), and will therefore only ever TLS access or not) and only one  
3947 authentication mechanism. Such Printer objects only have one URI listed in the "printer-uri-supported"  
3948 attribute. No matter the configuration of the Printer object (whether it has only one URI or more than one  
3949 URI), a client MUST supply only one URI in the target "printer-uri" operation attribute.

#### 3950 4.4.4 printer-name (name(127))

3951 This REQUIRED Printer attribute contains the name of the Printer object. It is a name that is more end-  
3952 user friendly than a URI. An administrator determines a printer's name and sets this attribute to that name.

3953 This name may be the last part of the printer's URI or it may be unrelated. In non-US-English locales, a  
3954 name may contain characters that are not allowed in a URI.

#### 3955 4.4.5 printer-location (text(127))

3956 This Printer attribute identifies the location of the device. This could include things like: "in Room 123A,  
3957 second floor of building XYZ".

#### 3958 4.4.6 printer-info (text(127))

3959 This Printer attribute identifies the descriptive information about this Printer object. This could include  
3960 things like: "This printer can be used for printing color transparencies for HR presentations", or "Out of  
3961 courtesy for others, please print only small (1-5 page) jobs at this printer", or even "This printer is going  
3962 away on July 1, 1997, please find a new printer".

#### 3963 4.4.7 printer-more-info (uri)

3964 This Printer attribute contains a URI used to obtain more information about this specific Printer object. For  
3965 example, this could be an HTTP type URI referencing an HTML page accessible to a Web Browser. The  
3966 information obtained from this URI is intended for end user consumption. Features outside the scope of IPP  
3967 can be accessed from this URI. The information is intended to be specific to this printer instance and site  
3968 specific services (e.g. job pricing, services offered, end user assistance). The device manufacturer may  
3969 initially populate this attribute.

#### 3970 4.4.8 printer-driver-installer (uri)

3971 This Printer attribute contains a URI to use to locate the driver installer for this Printer object. This  
3972 attribute is intended for consumption by automata. The mechanics of print driver installation is outside the  
3973 scope of [IPP](#).[this IPP/1.1 document](#). The device manufacturer may initially populate this attribute.

#### 3974 4.4.9 printer-make-and-model (text(127))

3975 This Printer attribute identifies the make and model of the device. The device manufacturer may initially  
3976 populate this attribute.

#### 3977 4.4.10 printer-more-info-manufacturer (uri)

3978 This Printer attribute contains a URI used to obtain more information about this type of device. The  
3979 information obtained from this URI is intended for end user consumption. Features outside the scope of  
3980 IPP can be accessed from this URI (e.g., latest firmware, upgrades, print drivers, optional features available,  
3981 details on color support). The information is intended to be germane to this printer without regard to site  
3982 specific modifications or services. The device manufacturer may initially populate this attribute.

## 3983 4.4.11 printer-state (type1 enum)

3984 This REQUIRED Printer attribute identifies the current state of the device. The "printer-state reasons"  
3985 attribute augments the "printer-state" attribute to give more detailed information about the Printer in the  
3986 given printer state.

3987 A Printer object need only update this attribute before responding to an operation which requests the  
3988 attribute; the Printer object NEED NOT update this attribute continually, since asynchronous event  
3989 notification is not part of ~~IPP/1.0~~IPP/1.1. A Printer NEED NOT implement all values if they are not  
3990 applicable to a given implementation.

3991 The following standard enum values are defined:

3992 Value Symbolic Name and Description

3993

3994 '3' 'idle': ~~Indicates that new jobs can start processing without waiting. Issue 31~~ **Issue 31** ~~If a Printer~~  
3995 ~~receives a job (whose required resources are ready) while in this state, such a job~~  
3996 ~~MUST transit into the 'processing' state immediately. If the "printer-state reasons"~~  
3997 ~~attribute contains any reasons, they MUST be reasons that would not prevent a job~~  
3998 ~~from transiting into the 'processing' state immediately, e.g., 'toner low'.~~

3999

4000 ~~Note: if a Printer controls more than one output device, the above definition implies~~  
4001 ~~that a Printer is 'idle' if at least one output device is idle.~~

4002

4003 '4' 'processing': ~~Indicates that jobs are processing; new jobs will wait before processing. Issue~~ **Issue**  
4004 **31** ~~If a Printer receives a job (whose required resources are ready) while in this state,~~  
4005 ~~such a job MUST transit into the 'pending' state immediately. Such a job MUST~~  
4006 ~~transit into the 'processing' state only after jobs ahead of it complete. If the "printer-~~  
4007 ~~state reasons" attribute contains any reasons, they MUST be reasons that do not~~  
4008 ~~prevent the current job from printing, e.g., 'toner low'.~~

4009

4010 ~~Note: if a Printer controls more than one output device, the above definition implies~~  
4011 ~~that a Printer is 'processing' if at least one output device is processing, and none is~~  
4012 ~~idle.~~

4013

4014 '5' 'stopped': ~~Indicates that no jobs can be processed and intervention is required. Issue 31~~ **Issue 31** ~~If a~~  
4015 ~~Printer receives a job (whose required resources are ready) while in this state, such a~~  
4016 ~~job MUST transit into the 'pending' state immediately. Such a job MUST transit into~~  
4017 ~~the 'processing' state only after some human fixes the problem that stopped the~~  
4018 ~~printer and after jobs ahead of it complete processing. If supported, Issue 30~~  
4019 ~~"printer-state reasons" attribute MUST contain at least one reason, e.g., 'media jam',~~  
4020 ~~which prevents it from either processing the current job or transitioning a 'pending'~~  
4021 ~~job to the 'processing' state.~~

4022

4023 ~~Note: if a Printer controls more than one output device, the above definition implies~~  
4024 ~~that a Printer is 'stopped' only if all output devices are stopped.~~

4025  
4026  
4027  
4028  
4029  
4030

~~Also, it is tempting to define 'stopped' as when a sufficient number of output devices are stopped and leave it to an implementation to define the sufficient number. But such a rule complicates the definition of 'stopped' and 'processing'. For example, with this alternate definition of 'stopped', a job can move from 'pending' to 'processing' without human intervention, even though the Printer is stopped.~~

4031  
4032

Values of "printer-state-reasons", such as 'spool-area-full', 'queue-full' and 'stopped-partly', MAY be used to provide further information. Issue 31

4033

#### 4.4.12 printer-state-reasons (1setOf type2 keyword)

4034  
4035

This **REQUIRED** Printer attribute supplies additional detail about the device's state. Some of these value definitions indicate conformance requirements; the rest are OPTIONAL. Issue 30

4036  
4037

Each keyword value MAY have a suffix to indicate its level of severity. The three levels are: report (least severe), warning, and error (most severe).

4038  
4039  
4040  
4041  
4042  
4043  
4044  
4045  
4046

- 'report': This suffix indicates that the reason is a "report". An implementation may choose to omit some or all reports. Some reports specify finer granularity about the printer state; others serve as a precursor to a warning. A report **MUST** contain nothing that could affect the printed output.
- 'warning': This suffix indicates that the reason is a "warning". An implementation may choose to omit some or all warnings. Warnings serve as a precursor to an error. A warning **MUST** contain nothing that prevents a job from completing, though in some cases the output may be of lower quality.
- 'error': This suffix indicates that the reason is an "error". An implementation **MUST** include all errors. If this attribute contains one or more errors, printer **MUST** be in the stopped state.

4047  
4048

If the implementation does not add any one of the three suffixes, all parties **MUST** assume that the reason is an "error".

4049  
4050  
4051  
4052  
4053

If a Printer object controls more than one output device, each value of this attribute MAY apply to one or more of the output devices. An error on one output device that does not stop the Printer object as a whole MAY appear as a warning in the Printer's "printer-state-reasons attribute". If the "printer-state" for such a Printer has a value of 'stopped', then there **MUST** be an error reason among the values in the "printer-state-reasons" attribute.

4054

The following standard keyword values are defined:

4055  
4056  
4057  
4058  
4059  
4060  
4061  
4062  
4063

- 'other': The device has detected an error other than one listed in this document.
- 'none': There are not reasons. This state reason is semantically equivalent to "printer-state-reasons" without any value and **MUST** be used, since the 1setOf attribute syntax requires at least one value.
- 'media-needed': A tray has run out of media.
- 'media-jam': The device has a media jam.
- 'moving-to-paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7) or other means, but the device(s) are taking an appreciable time to stop. Later, when all output has stopped, the "printer-state" becomes 'stopped', and the 'paused' value replaces the 'moving-to-paused' value in the "printer-state-reasons" attribute. This value **MUST** be supported, if

- 4064 the Pause-Printer operation is supported and the implementation takes significant time to pause a  
4065 device in certain circumstances. Issue 30
- 4066 'paused': Someone has paused the Printer object using the Pause-Printer operation (see section 3.2.7) or  
4067 other means and the Printer object's "printer-state" is 'stopped'. In this state, a Printer MUST NOT  
4068 produce printed output, but it MUST perform other operations requested by a client. If a Printer had  
4069 been printing a job when the Printer was paused, the Printer MUST resume printing that job when  
4070 the Printer is no longer paused and leave no evidence in the printed output of such a pause. This  
4071 value MUST be supported, if the Pause-Printer operation is supported. Issue 30
- 4072 'shutdown': Someone has removed a Printer object from service, and the device may be powered down  
4073 or physically removed. In this state, a Printer object MUST NOT produce printed output, and unless  
4074 the Printer object is realized by a print server that is still active, the Printer object MUST perform no  
4075 other operations requested by a client, including returning this value. If a Printer object had been  
4076 printing a job when it was shutdown, the Printer NEED NOT resume printing that job when the  
4077 Printer is no longer shutdown. If the Printer resumes printing such a job, it may leave evidence in  
4078 the printed output of such a shutdown, e.g. the part printed before the shutdown may be printed a  
4079 second time after the shutdown.
- 4080 'connecting-to-device': The Printer object has scheduled a job on the output device and is in the process  
4081 of connecting to a shared network output device (and might not be able to actually start printing the  
4082 job for an arbitrarily long time depending on the usage of the output device by other servers on the  
4083 network).
- 4084 'timed-out': The server was able to connect to the output device (or is always connected), but was unable  
4085 to get a response from the output device.
- 4086 'stopping': The Printer object is in the process of stopping the device and will be stopped in a while.  
4087 When the device is stopped, the Printer object will change the Printer object's state to 'stopped'. The  
4088 'stopping-warning' reason is never an error, even for a Printer with a single output device. When an  
4089 output-device ceases accepting jobs, the Printer will have this reason while the output device  
4090 completes printing.
- 4091 'stopped-partly': When a Printer object controls more than one output device, this reason indicates that  
4092 one or more output devices are stopped. If the reason is a report, fewer than half of the output  
4093 devices are stopped. If the reason is a warning, fewer than all of the output devices are stopped.
- 4094 'toner-low': The device is low on toner.
- 4095 ~~marker-supply-low:~~ 'toner-empty': The device is ~~low on marker supply (ink, paint, etc.)~~ out of toner.  
4096 'spool-area-full': The limit of persistent storage allocated for spooling has been reached. The Printer is  
4097 temporarily unable to accept more jobs. The Printer will remove this value when it is able to accept  
4098 more jobs. This value SHOULD be used by a non-spooling Printer that only accepts one or a small  
4099 number jobs at a time or a spooling Printer that has filled the spool space. Issue 20 Issue 30 and  
4100 Issue 31
- 4101 'cover-open': One or more covers on the device are open.
- 4102 'interlock-open': One or more interlock devices on the printer are unlocked.
- 4103 'door-open': One or more doors on the device are open.
- 4104 'input-tray-missing': One or more input trays are not in the device.
- 4105 'media-low': At least one input tray is low on media.
- 4106 'media-empty': At least one input tray is empty.
- 4107 'output-tray-missing': One or more output trays are not in the device
- 4108 'output-area-almost-full': One or more output area is almost full (e.g. tray, stacker, collator).

4109 'output-area-full': One or more output area is full. (e.g. tray, stacker, collator)  
4110 'marker-supply-low': The device is low on at least one marker supply. (e.g. toner, ink, ribbon)  
4111 'marker-supply-empty': The device is out of at least one marker supply. (e.g. toner, ink, ribbon)  
4112 'marker-waste-almost-full': The device marker supply waste receptacle is almost full.  
4113 'marker-waste-full': The device marker supply waste receptacle is full.  
4114 'fuser-over-temp': The fuser temperature is above normal.  
4115 'fuser-under-temp': The fuser temperature is below normal.  
4116 'opc-near-eol': The optical photo conductor is near end of life.  
4117 'opc-life-over': The optical photo conductor is no longer functioning.  
4118 'developer-low': The device is low on developer.  
4119 'developer-empty': The device is out of developer.  
4120 'interpreter-resource-unavailable': An interpreter resource is unavailable (i.e. font, form)  
4121

#### 4122 4.4.13 printer-state-message (text(MAX))

4123 This Printer attribute specifies the additional information about the printer state and printer state reasons in  
4124 human readable text. If the Printer object supports this attribute, the Printer object MUST be able to  
4125 generate this message in any of the natural languages identified by the Printer's "generated-natural-  
4126 language-supported" attribute (see the "attributes-natural-language" operation attribute specified in Section  
4127 3.1.4.1).

#### 4128 4.4.14 ipp-versions-supported (1setOf type2 keyword) Issue 36

4129 This REQUIRED attribute identifies the IPP protocol version(s) that this Printer supports, including major  
4130 and minor versions, i.e., the version numbers for which this Printer implementation meets the conformance  
4131 requirements. For version number validation, the Printer matches the (two-octet binary) "version-number"  
4132 parameter supplied by the client in each request (see sections 3.1.1 and 3.1.8) with the (US-ASCII) keyword  
4133 values of this attribute.

4134 The following standard keyword values are defined:

4135 '1.0': Meets the conformance requirement of IPP version 1.0 as specified in RFC 2566 [RFC2566] and  
4136 RFC 2565 [RFC2565] including any extensions registered according to Section 6 and any extension  
4137 defined in this version or any future version of the IPP "Model and Semantics" document or the IPP  
4138 "Encoding and Transport" document following the rules, if any, when the "version-number"  
4139 parameter is '1.0'.

4140 '1.1': Meets the conformance requirement of IPP version 1.1 as specified in this document and [IPP-  
4141 PRO] including any extensions registered according to Section 6 and any extension defined in any  
4142 future versions of the IPP "Model and Semantics" document or the IPP Encoding and Transport  
4143 document following the rules, if any, when the "version-number" parameter is '1.1'.

#### 4144 4.4.15 operations-supported (1setOf type2 enum)

4145 This REQUIRED Printer attribute specifies the set of supported operations for this Printer object and  
4146 contained Job objects.

4147 ~~A~~This attribute is encoded as any other enum attribute syntax according to [IPP-PRO] as 32-bits.  
 4148 However, all 32-bit enum values for this attribute MUST NOT exceed 0x00008FFF, since these same  
 4149 values are also passed in two octets in the "operation-id" parameter (see section 3.1.1) in each Protocol  
 4150 request with the two high order octets omitted in order to indicate the operation being performed [IPP-  
 4151 PRO].

4152 The following standard enum and "operation-id" (see section 3.1.2) values are defined:

4153	Value	Operation Name
4154	-----	-----
4155		
4156	0x0000	reserved, not used
4157	0x0001	reserved, not used
4158	0x0002	Print-Job
4159	0x0003	Print-URI
4160	0x0004	Validate-Job
4161	0x0005	Create-Job
4162	0x0006	Send-Document
4163	0x0007	Send-URI
4164	0x0008	Cancel-Job
4165	0x0009	Get-Job-Attributes
4166	0x000A	Get-Jobs
4167	0x000B	Get-Printer-Attributes
4168	<u>0x000C</u>	<u>Hold-Job</u>
4169	<u>0x000D</u>	<u>Release-Job</u>
4170	<u>0x000E</u>	<u>Restart-Job</u>
4171	<u>0x000F</u>	<u>reserved for a future operation</u>
4172	<u>0x0010</u>	<u>Pause-Printer</u>
4173	<u>0x0011</u>	<u>Resume-Printer</u>
4174	<u>0x0012</u>	<u>Purge-Jobs</u>
4175	<del>0x000C-0x3FFF</del> <u>0x00013-0x3FFF</u>	reserved for future operations
4176	0x4000-0x8FFF	reserved for private extensions
4177		

4178 ~~This~~The reserved block for private extensions allows for ~~certain~~ vendors to implement private extensions  
 4179 that are guaranteed to not conflict with future registered extensions. However, there is no guarantee that  
 4180 two or more private extensions will not conflict.

#### 4181 4.4.16 multiple-document-jobs-supported (boolean) **Issue 34**

4182 This Printer attribute indicates whether or not the Printer supports more than one document per job, i.e.,  
 4183 more than one Send-Document or Send-Data operation with document data. If the Printer supports the  
 4184 Create-Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

## 4185 4.4.17 charset-configured (charset)

4186 This REQUIRED Printer attribute identifies the charset that the Printer object has been configured to  
4187 represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or  
4188 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-  
4189 make-and-model" (text). Therefore, the value of the Printer object's "charset-configured" attribute MUST  
4190 also be among the values of the Printer object's "charset-supported" attribute.

## 4191 4.4.18 charset-supported (1setOf charset)

4192 This REQUIRED Printer attribute identifies the set of charsets that the Printer and contained Job objects  
4193 support in attributes with attribute syntax 'text' and 'name'. At least the value 'utf-8' MUST be present, since  
4194 IPP objects MUST support the UTF-8 [\[RFC2044\]](#)[\[RFC2279\]](#) charset. If a Printer object supports a charset,  
4195 it means that for all attributes of syntax 'text' and 'name' the IPP object MUST (1) accept the charset in  
4196 requests and return the charset in responses as needed.

4197 If more charsets than UTF-8 are supported, the IPP object MUST perform charset conversion between the  
4198 charsets as described in Section 3.1.4.2.

## 4199 4.4.19 natural-language-configured (naturalLanguage)

4200 This REQUIRED Printer attribute identifies the natural language that the Printer object has been configured  
4201 to represent 'text' and 'name' Printer attributes that are set by the operator, system administrator, or  
4202 manufacturer, i.e., for "printer-name" (name), "printer-location" (text), "printer-info" (text), and "printer-  
4203 make-and-model" (text). When returning these Printer attributes, the Printer object MAY return them in the  
4204 configured natural language specified by this attribute, instead of the natural language requested by the  
4205 client in the "attributes-natural-language" operation attribute. See Section 3.1.4.1 for the specification of  
4206 the OPTIONAL multiple natural language support. Therefore, the value of the Printer object's "natural-  
4207 language-configured" attribute MUST also be among the values of the Printer object's "generated-natural-  
4208 language-supported" attribute.

## 4209 4.4.20 generated-natural-language-supported (1setOf naturalLanguage)

4210 This REQUIRED Printer attribute identifies the natural language(s) that the Printer object and contained  
4211 Job objects support in attributes with attribute syntax 'text' and 'name'. The natural language(s) supported  
4212 depends on implementation and/or configuration. Unlike charsets, IPP objects MUST accept requests with  
4213 any natural language or any Natural Language Override whether the natural language is supported or not.

4214 If a Printer object supports a natural language, it means that for any of the attributes for which the Printer or  
4215 Job object generates messages, i.e., for the "job-state-message" and "printer-state-message" attributes and  
4216 Operation Messages (see Section 3.1.5) in operation responses, the Printer and Job objects MUST be able  
4217 to generate messages in any of the Printer's supported natural languages. See section 3.1.4 for the  
4218 [specification](#)[definition](#) of 'text' and 'name' attributes in operation requests and responses.

4219 Note: A Printer object that supports multiple natural languages, often has separate catalogs of messages,  
4220 one for each natural language supported.

## 4221 4.4.21 document-format-default (mimeMediaType)

4222 This REQUIRED Printer attribute identifies the document format that the Printer object has been  
4223 configured to assume if the client does not supply a "document-format" operation attribute in any of the  
4224 operation requests that supply document data. The standard values for this attribute are Internet Media  
4225 types (sometimes called MIME types). For further details see the description of the 'mimeMediaType'  
4226 attribute syntax in Section 4.1.9.

## 4227 4.4.22 document-format-supported (1setOf mimeMediaType)

4228 This REQUIRED Printer attribute identifies the set of document formats that the Printer object and  
4229 contained Job objects can support. For further details see the description of the 'mimeMediaType' attribute  
4230 syntax in Section 4.1.9.

## 4231 4.4.23 printer-is-accepting-jobs (boolean)

4232 This REQUIRED Printer attribute indicates whether the printer is currently able to accept jobs, i.e., is  
4233 accepting Print-Job, Print-URI, and Create-Job requests. If the value is 'true', the printer is accepting jobs.  
4234 If the value is 'false', the Printer object is currently rejecting any jobs submitted to it. In this case, the  
4235 Printer object returns the 'server-error-not-accepting-jobs' status code.

4236 ~~Note:~~ This value is independent of the "printer-state" and "printer-state-reasons" attributes because its value  
4237 does not affect the current job; rather it affects future jobs. This attribute, when 'false', may causes the  
4238 Printer to reject jobs even when the "printer-state" is 'idle' or, when 'true', it may causes the Printer object to  
4239 accept jobs even when the "printer-state" is 'stopped'.

## 4240 4.4.24 queued-job-count (integer(0:MAX))

4241 This ~~RECOMMENDED~~REQUIRED Printer attribute contains a count of the number of jobs that are either  
4242 'pending', 'processing', 'pending-held', or 'processing-stopped' and is set by the Printer object. **Issue 29**

## 4243 4.4.25 printer-message-from-operator (text(127))

4244 This Printer attribute provides a message from an operator, system administrator or "intelligent" process to  
4245 indicate to the end user information or status of the printer, such as why it is unavailable or when it is  
4246 expected to be available.

## 4247 4.4.26 color-supported (boolean)

4248 This Printer attribute identifies whether the device is capable of any type of color printing at all, including  
4249 highlight color. All document instructions having to do with color are embedded within the document PDL  
4250 (none are external IPP attributes in ~~IPP/1.0~~:IPP/1.1).

4251 Note: end-users are able to determine the nature and details of the color support by querying the "printer-  
4252 more-info-manufacturer" Printer attribute.

## 4253 4.4.27 reference-uri-schemes-supported (1setOf uriScheme)

4254 This Printer attribute specifies which URI schemes are supported for use in the "document-uri" operation  
4255 attribute of the Print-URI or Send-URI operation. If a Printer object supports these optional operations, it  
4256 MUST support the "reference-uri-schemes-supported" Printer attribute with at least the following schemed  
4257 URI value:

4258 'ftp': The Printer object will use an FTP 'get' operation as defined in RFC 2228 [RFC2228] using FTP  
4259 URLs as defined by [RFC2396] and[RFC2316].  
4260

4261 The Printer object MAY OPTIONALLY support other URI schemes (see section 4.1.6).

## 4262 4.4.28 pdl-override-supported (type2 keyword)

4263 This REQUIRED Printer attribute expresses the ability for a particular Printer implementation to either  
4264 attempt to override document data instructions with IPP attributes or not.

4265 This attribute takes on the following values:

- 4266 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take  
4267 precedence over embedded instructions in the document data, however there is no guarantee.
- 4268 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute  
4269 values take precedence over embedded instructions in the document data.  
4270

4271 Section 15 contains a full description of how this attribute interacts with and affects other IPP attributes,  
4272 especially the "ipp-attribute-fidelity" attribute.

## 4273 4.4.29 printer-up-time (integer(1:MAX))

4274 This REQUIRED Printer attribute indicates the amount of time (in seconds) that this Printer instance of this  
4275 Printer implementation has been up and running. The value is a monotonically increasing value starting  
4276 from 1 when the Printer object is started-up (initialized, booted, etc.). This value is used to populate the  
4277 Event Time Job Description Job attributes "time-at-creation", "time-at-processing", and "time-at-  
4278 completed" (see section 4.3.14). ~~These time values are all measured in seconds and all have meaning only  
4279 relative to this attribute, "printer-up-time".~~

4280 If the Printer object goes down at some value 'n', and comes back up, the implementation MAY:

- 4281 1. Know how long it has been down, and resume at some value greater than 'n', or
- 4282 2. Restart from 1.  
4283

4284 In other words, if the device or devices that the Printer object is representing are restarted or power cycled,  
4285 the Printer object MAY continue counting this value or MAY reset this value to 1 depending on  
4286 implementation. However, if the Printer object software ceases running, and restarts without knowing the  
4287 last value for "printer-up-time", the implementation MUST reset this value to 1. If this value is reset and  
4288 the Printer has persistent jobs, the Printer MUST reset the "time-at-xxx(integer) Event Time Job

4289 Description attributes according to Section 4.3.14. Issue 17 In the first case, the Printer SHOULD not  
4290 ~~tweak any existing related Job attributes ("time-at-creation", "time-at-processing", and "time-at-~~  
4291 ~~completed"). In the second case, the Printer object SHOULD reset those attributes to 0. If a client queries a~~  
4292 ~~time-related Job attribute and finds the value to be 0, the client MUST assume that the Job was submitted in~~  
4293 ~~some life other than the Printer's current life. An implementation MAY use both implementation~~  
4294 ~~alternatives, depending on warm versus cold start, respectively.~~

#### 4295 4.4.30 printer-current-time (dateTime)

4296 This Printer attribute indicates the current ~~date and absolute wall-clock~~ time. ~~If an implementation supports~~  
4297 ~~this attribute, then a client could calculate the absolute wall-clock time each Job's~~ This value is used to  
4298 populate the Event Time Job Description attributes: "time-at-creation", "time-at-processing", and "time-at-  
4299 completed" (see Section 4.3.14). ~~attributes by using both "printer-up-time" and this attribute, "printer-~~  
4300 ~~current-time". If an implementation does not support this attribute, a client can only calculate the relative~~  
4301 ~~time of certain events based on the REQUIRED "printer-up-time" attribute.~~

4302 The date and time is obtained on a "best efforts basis" and does not have to be that precise in order to work  
4303 in practice. A Printer implementation sets the value of this attribute by obtaining the date and time via  
4304 some implementation-dependent means, such as getting the value from a network time server, initialization  
4305 at time of manufacture, or setting by an administrator. See [IPP-IIG] for examples. If an implementation  
4306 supports this attribute and the implementation knows that it has not yet been set to a correct value, then the  
4307 implementation MUST return the value of this attribute using the out-of-band 'no-value' meaning not  
4308 configured. See the beginning of section 4.1. Issue 17

4309 The time zone of this attribute NEED NOT be the time zone used by people located near the Printer object  
4310 or device. The client MUST NOT expect that the time zone of any received 'dateTime' value to be in the  
4311 time zone of the client or in the time zone of the people located near the printer. Issue 17

4312 The client SHOULD display any dateTime attributes to the user in client local time by converting the  
4313 'dateTime' value returned by the server to the time zone of the client, rather than using the time zone  
4314 returned by the Printer in attributes that use the 'dateTime' attribute syntax. Issue 17

#### 4315 4.4.31 multiple-operation-time-out (integer(1:MAX))

4316 This Printer attributes identifies the minimum time (in seconds) that the Printer object waits for additional  
4317 Send-Document or Send-URI operations to follow a still-open multi-document Job object before taking  
4318 any recovery actions, such as the ones indicated in section 3.3.1. If the Printer object supports the Create-  
4319 Job and Send-Document operations (see section 3.2.4 and 3.3.1), it MUST support this attribute.

4320 It is RECOMMENDED that vendors supply a value for this attribute that is between 60 and 240 seconds.  
4321 An implementation MAY allow a system administrator to set this attribute (by means outside this IPP/1.1  
4322 document). If so, the system administrator MAY be able to set values outside this range.

## 4323 4.4.32 compression-supported (1setOf type3 keyword)

4324 This **REQUIRED** Printer attribute identifies the set of supported compression algorithms for document  
4325 data. Compression only applies to the document data; compression does not apply to the encoding of the  
4326 IPP operation itself. The supported values are used to validate the client supplied "compression" operation  
4327 attributes in Print-Job, Send-Document, and Send-URI requests. **Issue 28**

4328 Standard values are :

- 4329 'none': no compression is used.
- 4330 'deflate': ZIP public domain inflate/deflate) compression technology
- 4331 'gzip' GNU zip compression technology described in RFC 1952 [RFC1952].
- 4332 'compress': UNIX compression technology

4333

## 4334 4.4.33 job-k-octets-supported (rangeOfInteger(0:MAX))

4335 This Printer attribute specifies the upper and lower bounds of total sizes of jobs in K octets, i.e., in units of  
4336 1024 octets. The supported values are used to validate the client supplied "job-k-octets" operation attributes  
4337 in create requests. The corresponding job description attribute "job-k-octets" is defined in section 4.3.17.1.

## 4338 4.4.34 job-impressions-supported (rangeOfInteger(0:MAX))

4339 This Printer attribute specifies the upper and lower bounds for the number of impressions per job. The  
4340 supported values are used to validate the client supplied "job-impressions" operation attributes in create  
4341 requests. The corresponding job description attribute "job-impressions" is defined in section 4.3.17.2.

## 4342 4.4.35 job-media-sheets-supported (rangeOfInteger(0:MAX))

4343 This Printer attribute specifies the upper and lower bounds for the number of media sheets per job. The  
4344 supported values are used to validate the client supplied "job-media-sheets" operation attributes in create  
4345 requests. The corresponding Job attribute "job-media-sheets" is defined in section 4.3.17.3.

4346 4.4.36 pages-per-minute (integer(0:MAX))

4347 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which  
4348 may be generated by this printer (e.g., simplex, black-and-white). This attribute is informative, not a  
4349 service guarantee. Generally, it is the value used in the marketing literature to describe the device.

4350 A value of 0 indicates a device that takes more than two minutes to process a page.

4351 4.4.37 pages-per-minute-color (integer(0:MAX))

4352 This Printer attributes specifies the nominal number of pages per minute to the nearest whole number which  
4353 may be generated by this printer when printing color (e.g., simplex, color). For purposes of this attribute,  
4354 "color" means the same as for the "color-supported" attribute, namely, the device is capable of any type of

4355 color printing at all, including highlight color. This attribute is informative, not a service guarantee.  
4356 Generally, it is the value used in the marketing literature to describe the color capabilities of this device.

4357 A value of 0 indicates a device that takes more than two minutes to process a page.

4358 If a color device has several color modes, it MAY use the pages-per-minute value for this attribute that  
4359 corresponds to the mode that produces the highest number.

4360 Black and white only printers MUST NOT support this attribute. If this attribute is present, then the "color-  
4361 supported" Printer description attribute MUST be present and have a 'true' value.

4362 The values of these two attributes returned by the Get-Printer-Attributes operation MAY be affected by the  
4363 "document-format" attribute supplied by the client in the Get-Printer-Attributes request. In other words, the  
4364 implementation MAY have different speeds depending on the document format being processed. See  
4365 section 3.2.5.1 Get-Printer-Attributes.

## 4366 5. Conformance

4367 This section describes conformance issues and requirements. This document introduces model entities such  
4368 as objects, operations, attributes, attribute syntaxes, and attribute values. These conformance sections  
4369 describe the conformance requirements which apply to these model entities.

### 4370 5.1 Client Conformance Requirements

4371 This section describes the conformance requirements for a client (see section 2.1), whether it be:

- 4372 1. contained within software controlled by an end user, e.g. activated by the "Print" menu item in an  
4373 application that sends IPP requests or
- 4374 2. the print server component that sends IPP requests to either an output device or another  
4375 "downstream" print server. Issue 4

4376 A conforming client MUST support all REQUIRED operations as defined in this document. For each  
4377 attribute included in an operation request, a conforming client MUST supply a value whose type and value  
4378 syntax conforms to the requirements of the Model document as specified in Sections 3 and 4. A  
4379 conforming client MAY supply any registered extensions and/or private extensions in an operation request,  
4380 as long as they meet the requirements in Section 1.1.

4381 Otherwise, there are no conformance requirements placed on the user interfaces provided by IPP clients or  
4382 their applications. For example, one application might not allow an end user to submit multiple documents  
4383 per job, while another does. One application might first query a Printer object in order to supply a graphical  
4384 user interface (GUI) dialogue box with supported and default values whereas a different implementation  
4385 might not.

4386 When sending a request, an IPP client NEED NOT supply any attributes that are indicated as  
4387 OPTIONALLY supplied by the client.

4388 A client MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their full  
4389 range, that may be returned to it in a response from a Printer object. In particular for each attribute that the  
4390 client supports whose attribute syntax is 'text', the client MUST accept and process both the  
4391 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the client supports  
4392 whose attribute syntax is 'name', the client MUST accept and process both the 'nameWithoutLanguage' and  
4393 'nameWithLanguage' forms. For presentation purposes, truncation of long attribute values is not  
4394 recommended. A recommended approach would be for the client implementation to allow the user to scroll  
4395 through long attribute values.

4396 A ~~query~~-response ~~may~~**MAY** contain attribute groups, attributes, ~~attribute syntaxes, and~~-values, ~~and status~~  
4397 ~~codes~~ that the client does not expect. Therefore, a client implementation MUST gracefully handle such  
4398 responses and not refuse to inter-operate with a conforming Printer that is returning ~~extended~~ registered or  
4399 private ~~attributes and/or extensions, including attribute groups, attributes, attribute syntaxes, -attribute~~  
4400 ~~values, and status codes~~ that conform to Section 1.1. Clients may choose to ignore any parameters,  
4401 attributes, ~~attribute syntaxes,~~ or values that they do not understand. **Issue 25 and Issue 26**

4402 While a client is sending data to a printer, it SHOULD do its best to prevent a channel from being closed by  
4403 a lower layer when the channel is blocked (i.e. flow-controlled off) for whatever reason, e.g. 'out of paper'  
4404 or 'job ahead hasn't freed up enough memory'. However, the layer that launched the print submission (e.g.  
4405 an end user) MAY close the channel in order to cancel the job. When a client closes a channel, a Printer  
4406 MAY print all or part of the received portion of the document. See the "Encoding and Transport" document  
4407 [IPP-PRO] for more details. **Issue 4 and Issue 5**

4408 A client MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport document  
4409 [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as defined in the  
4410 IPP/1.1 Encoding and Transport document [IPP-PRO]. See also section 8 of this document. **Issue 32**

## 4411 5.2 IPP Object Conformance Requirements

4412 This section specifies the conformance requirements for conforming implementations ~~with respect to~~ **of IPP**  
4413 **objects (see section 2), operations, and attributes. These requirements apply to an IPP object whether it is:**

4414 (1) an (embedded) device component that accepts IPP requests and controls the device or

4415 (2) a component of a print server that accepts IPP requests (where the print server control one or  
4416 more networked devices using IPP or other protocols). **Issue 4**

### 4417 5.2.1 Objects

4418 Conforming implementations MUST implement all of the model objects as defined in this  
4419 ~~specification~~**document** in the indicated sections:

4420 Section 2.1 - Printer Object

## 4421 Section 2.2 - Job Object

## 4422 5.2.2 Operations

4423 Conforming IPP object implementations MUST implement all of the REQUIRED model operations,  
4424 including REQUIRED responses, as defined in this [specification document](#) in the indicated sections:

4425 For a Printer object:

4426	Print-Job (section 3.2.1)	REQUIRED
4427	Print-URI (section 3.2.2)	OPTIONAL
4428	Validate-Job (section 3.2.3)	REQUIRED
4429	Create-Job (section 3.2.4)	OPTIONAL
4430	Get-Printer-Attributes (section 3.2.5)	REQUIRED
4431	Get-Jobs (section 3.2.6)	REQUIRED
4432	<u>Pause-Printer (section 3.2.7)</u>	<u>OPTIONAL</u>
4433	<u>Resume-Printer (section 3.2.8)</u>	<u>OPTIONAL</u>
4434	<u>Purge-Jobs (section 3.2.9)</u>	<u>OPTIONAL</u>

4435

4436 For a Job object:

4437	Send-Document (section 3.3.1)	OPTIONAL
4438	Send-URI (section 3.3.2)	OPTIONAL
4439	Cancel-Job (section 3.3.3)	REQUIRED
4440	Get-Job-Attributes (section 3.3.4)	REQUIRED
4441	<u>Hold-Job (section 3.3.5)</u>	<u>OPTIONAL</u>
4442	<u>Release-Job (section 3.3.6)</u>	<u>OPTIONAL</u>
4443	<u>Restart-Job (section 3.3.7)</u>	<u>OPTIONAL</u>

4444

4445 Conforming IPP objects MUST support all REQUIRED operation attributes and all values of such  
4446 attributes if so indicated in the description. Conforming IPP objects MUST ignore all unsupported or  
4447 unknown operation attributes or operation attribute groups received in a request, but MUST reject a request  
4448 that contains a supported operation attribute that contains an unsupported value.

4449 Conforming IPP objects MAY return operation responses that contain attributes groups, attributes names,  
4450 attribute syntaxes, attribute values, and status codes that are extensions to this standard. The additional  
4451 attribute groups MAY occur in any order. Issue 26

4452 The following section on object attributes specifies the support required for object attributes.

## 4453 5.2.3 IPP Object Attributes

4454 Conforming IPP objects MUST support all of the REQUIRED object attributes, as defined in this  
4455 [specification document](#) in the indicated sections.

4456 If an object supports an attribute, it MUST support only those values specified in this document or through  
4457 the extension mechanism described in section 5.2.4. It MAY support any non-empty subset of these values.  
4458 That is, it MUST support at least one of the specified values and at most all of them.

4459 5.2.4 Versions

4460 Clients MUST meet the conformance requirements for clients specified in this document and [IPP-PRO]  
4461 and SHOULD also support version 1.0, i.e., SHOULD meet the conformance requirements for clients as  
4462 specified in [RFC2566] and [RFC2565].

4463 IPP Printer and Job objects MUST meet the conformance requirements for IPP objects specified in this  
4464 document and [IPP-PRO]. For interoperability with IPP/1.0 clients, IPP/1.1 objects SHOULD also meet  
4465 the conformance requirements for IPP objects as specified in [RFC2566] and [RFC2565].

4466 Clients MUST send requests containing a "version-number" parameter with a '1.1' value and SHOULD try  
4467 supplying alternate version numbers if they receive a 'server-error-version-not-supported' error return in a  
4468 response.

4469 IPP objects MUST accept requests containing a "version-number" parameter with a '1.1' value (or reject the  
4470 request if the operation is not supported). IPP objects SHOULD accept any request with the major version  
4471 '1' (or reject the request if the operation is not supported). See section 3.1.8. **ISSUE 36**

## 4472 5.2.5 Extensions

4473 A conforming IPP object MAY support registered extensions and private extensions, as long as they meet  
4474 the requirements specified in Section 1.1.

4475 For each attribute included in an operation response, a conforming IPP object MUST return a value whose  
4476 type and value syntax conforms to the requirement of the Model document as specified in Sections 3 and 4.

## 4477 5.2.6 Attribute Syntaxes

4478 An IPP object MUST be able to accept any of the attribute syntaxes defined in Section 4.1, including their  
4479 full range, in any operation in which a client may supply attributes or the system administrator may  
4480 configure attributes (by means outside the scope of ~~IPP/1.0~~this IPP/1.1 document). In particular for each  
4481 attribute that the IPP object supports whose attribute syntax is 'text', the IPP object MUST accept and  
4482 process both the 'textWithoutLanguage' and 'textWithLanguage' forms. Similarly, for each attribute that the  
4483 IPP object supports whose attribute syntax is 'name', the IPP object MUST accept and process both the  
4484 'nameWithoutLanguage' and 'nameWithLanguage' forms. Furthermore, an IPP object MUST return  
4485 attributes to the client in operation responses that conform to the syntax specified in Section 4.1, including  
4486 their full range if supplied previously by a client.

4487 5.2.7 Security Issue 32

4488 An IPP Printer implementation MUST/SHOULD ~~[which is to be determined in consultation with the Area~~  
4489 ~~Director]~~ contain support for Client Authentication as defined in the IPP/1.1 Encoding and Transport  
4490 document [IPP-PRO]. A Printer implementation MAY allow an administrator to configure the Printer so  
4491 that all, some, or none of the users are authenticated. See also section 8 of this document.

4492 An IPP Printer implementation SHOULD contain support for Operation Privacy and Server Authentication  
4493 as defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation MAY  
4494 allow an administrator to configure the degree of support for Operation Privacy and Server Authentication.  
4495 See also section 8 of this document.

4496 Security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a  
4497 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is  
4498 configured to enforce Digest Authentication, it MUST do the same for a version '1.0' request.

### 4499 5.3 Charset and Natural Language Requirements

4500 All clients and IPP objects MUST support the 'utf-8' charset as defined in section 4.1.7.

4501 IPP objects MUST be able to accept any client request which correctly uses the "attributes-natural-  
4502 language" operation attribute or the Natural Language Override mechanism on any individual attribute  
4503 whether or not the natural language is supported by the IPP object. If an IPP object supports a natural  
4504 language, then it MUST be able to translate (perhaps by table lookup) all generated 'text' or 'name' attribute  
4505 values into one of the supported languages (see section 3.1.4). That is, the IPP object that supports a  
4506 natural language NEED NOT be a general purpose translator of any arbitrary 'text' or 'name' value supplied  
4507 by the client into that natural language. However, the object MUST be able to translate (automatically  
4508 generate) any of its own attribute values and messages into that natural language.

### 4509 ~~5.4 Security Conformance Requirements~~

4510 ~~Conforming IPP Printer objects MAY support Secure Socket Layer Version 3 (SSL3) [SSL] access, support~~  
4511 ~~access without SSL3 or support both means of access.~~

4512 ~~Conforming IPP clients SHOULD support SSL3 access and non-SSL3 access. Note: This client~~  
4513 ~~requirement to support both means that conforming IPP clients will be able to inter-operate with any IPP~~  
4514 ~~Printer object.~~

4515 ~~For a detailed discussion of security considerations and the IPP application security profile required for~~  
4516 ~~SSL3 support, see section 8.~~

## 4517 6. IANA Considerations (registered and private extensions)

4518 This section describes how IPP can be extended to allow the following registered and private extensions to  
4519 IPP:

- 4520 1. keyword attribute values
- 4521 2. enum attribute values
- 4522 3. attributes
- 4523 4. attribute syntaxes
- 4524 5. operations

4525 6. attribute groups

4526 7. status codes

4527

4528 Extensions registered for use with ~~IPP/1.0~~IPP/1.1 are OPTIONAL for client and IPP object conformance to  
4529 the ~~IPP/1.0~~IPP/1.1 Model ~~specification~~document.

4530 These extension procedures are aligned with the guidelines as set forth by the IESG [IANA-CON]. Section  
4531 11 describes how to propose new registrations for consideration. IANA will reject registration proposals  
4532 that leave out required information or do not follow the appropriate format described in Section 11. IPP/1.1  
4533 may also be extended by an appropriate RFC that specifies any of the above extensions.

#### 4534 6.1 Typed 'keyword' and 'enum' Extensions

4535 IPP allows for 'keyword' and 'enum' extensions (see sections 4.1.2.3 and 4.1.4). This document uses  
4536 prefixes to the 'keyword' and 'enum' basic attribute syntax type in order to communicate extra information  
4537 to the reader through its name. This extra information is not represented in the protocol because it is  
4538 unimportant to a client or Printer object. The list below describes the prefixes and their meaning.

4539 "type1": This IPP specification document must be revised to add a new keyword or a new enum. No  
4540 private keywords or enums are allowed.

4541

4542 "type2": Implementers can, at any time, add new keyword or enum values by proposing the complete  
4543 specification to IANA:

4544

4545 iana@iana.org

4546

4547 IANA will forward the registration proposal to the IPP Designated Expert who will review the  
4548 proposal with a mailing list that the Designated Expert keeps for this purpose. Initially, that list will  
4549 be the mailing list used by the IPP WG:

4550

4551 ipp@pwg.org

4552

4553 even after the IPP WG is disbanded as permitted by [IANA-CON]. The IPP Designated Expert is  
4554 appointed by the IESG Area Director responsible for IPP, according to [IANA-CON].

4555

4556           When a type2 keyword or enum is approved, the IPP Designated Expert becomes the point of  
4557           contact for any future maintenance that might be required for that registration.

4558  
4559           "type3": Implementers can, at any time, add new keyword and enum values by submitting the complete  
4560           specification to IANA as for type2 who will forward the proposal to the IPP Designated Expert.  
4561           While no additional technical review is required, the IPP Designated Expert may, at his/her  
4562           discretion, forward the proposal to the same mailing list as for type2 registrations for advice and  
4563           comment.

4564  
4565           When a type3 keyword or enum is approved by the IPP Designated Expert, the original proposer  
4566           becomes the point of contact for any future maintenance that might be required for that registration.

4567

4568           For type2 and type3 keywords, the proposer includes the name of the keyword in the registration proposal  
4569           and the name is part of the technical review.

4570           After type2 and type3 enums specifications are approved, the IPP Designated Expert in consultation with  
4571           IANA assigns the next available enum number for each enum value.

4572           IANA will publish approved type2 and type3 keyword and enum attributes value registration specifications  
4573           in:

4574           [ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt](ftp://ftp.isi.edu/iana/assignments/ipp/attribute-values/xxx/yyy.txt)

4575           where xxx is the attribute name that specifies the initial values and yyy.txt is a descriptive file name that  
4576           contains one or more enums or keywords approved at the same time. For example, if several additional  
4577           enums for stapling are approved for use with the "finishings" attribute (and "finishings-default" and  
4578           "finishings-supported" attributes), IANA will publish the additional values in the file:

4579           [ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt](ftp://ftp.isi.edu/iana/assignments/ipp/attribute-values/finishings/stapling.txt)

4580           Note: Some attributes are defined to be: 'type3 keywords' | 'name' which allows for attribute values to be  
4581           extended by a site administrator with administrator defined names. Such names are not registered with  
4582           IANA.

4583           By definition, each of the three types above assert some sort of registry or review process in order for  
4584           extensions to be considered valid. Each higher numbered level (1, 2, 3) tends to be decreasingly less  
4585           stringent than the previous level. Therefore, any typeN value MAY be registered using a process for some  
4586           typeM where M is less than N, however such registration is NOT REQUIRED. For example, a type3 value  
4587           MAY be registered in a type 1 manner (by being included in a future version of an IPP specification),  
4588           however, it is NOT REQUIRED.

4589           This [specification document](#) defines keyword and enum values for all of the above types, including type3  
4590           keywords.

4591           For private (unregistered) keyword extensions, implementers SHOULD use keywords with a suitable  
4592           distinguishing prefix, such as "xxx-" where xxx is the (lowercase) fully qualified company name registered

4593 with IANA for use in domain names [RFC1035]. For example, if the company XYZ Corp. had obtained  
4594 the domain name "XYZ.com", then a private keyword 'abc' would be: 'xyz.com-abc'.

4595 Note: RFC 1035 [RFC1035] indicates that while upper and lower case letters are allowed in domain names,  
4596 no significance is attached to the case. That is, two names with the same spelling but different case are to  
4597 be treated as if identical. Also, the labels in a domain name must follow the rules for ARPANET host  
4598 names: They must start with a letter, end with a letter or digit, and have as interior characters only letters,  
4599 digits, and hyphen. Labels must be 63 characters or less. Labels are separated by the "." character.

4600 For private (unregistered) enum extension, implementers MUST use values in the reserved integer range  
4601 which is 2\*\*30 to 2\*\*31-1.

## 4602 6.2 Attribute Extensibility

4603 Attribute names are type2 keywords. Therefore, new attributes may be registered and have the same status  
4604 as attributes in this document by following the type2 extension rules. For private (unregistered) attribute  
4605 extensions, implementers SHOULD use keywords with a suitable distinguishing prefix as described in  
4606 Section 6.1.

4607 IANA will publish approved attribute registration specifications as separate files:

4608 ftp.isi.edu/iana/assignments/ipp/attributes/xxx-yyy.txt

4609 where "xxx-yyy" is the new attribute name.

4610 If a new Printer object attribute is defined and its values can be affected by a specific document format, its  
4611 specification needs to contain the following sentence:

4612 "The value of this attribute returned in a Get-Printer-Attributes response MAY depend on the  
4613 "document-format" attribute supplied (see Section 3.2.5.1)."

4614 If the specification does not, then its value in the Get-Printer-Attributes response MUST NOT depend on  
4615 the "document-format" supplied in the request. When a new Job Template attribute is registered, the value  
4616 of the Printer attributes MAY vary with "document-format" supplied in the request without the  
4617 specification having to indicate so.

## 4618 6.3 Attribute Syntax Extensibility

4619 Attribute syntaxes are like type2 enums. Therefore, new attribute syntaxes may be registered and have the  
4620 same status as attribute syntaxes in this document by following the type2 extension rules described in  
4621 Section 6.1. The value codes that identify each of the attribute syntaxes are assigned in the [Encoding and  
4622 Transport](#) "Encoding and Transport" specification document [IPP-PRO], including a designated range for  
4623 private, experimental use.

4624 For attribute syntaxes, the IPP Designated Expert in consultation with IANA assigns the next attribute  
4625 syntax code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute  
4626 syntax registration specifications as separate files:

4627         ftp.isi.edu/iana/assignments/ipp/attribute-syntaxes/xxx-yyy.txt

4628 where 'xxx-yyy' is the new attribute syntax name.

#### 4629 6.4 Operation Extensibility

4630 Operations may also be registered following the type2 procedures described in Section 6.1, though major  
4631 new operations will usually be done by a new standards track RFC that augments this document. For  
4632 private (unregistered) operation extensions, implementers MUST use the range for the "operation-id" in  
4633 requests specified in Section 4.4.15 "operations-supported" Printer attribute.

4634 For operations, the IPP Designated Expert in consultation with IANA assigns the next operation-id code as  
4635 specified in Section 4.4.15. IANA will publish approved operation registration specifications as separate  
4636 files:

4637         ftp.isi.edu/iana/assignments/ipp/operations/Xxx-Yyy.txt

4638 where "Xxx-Yyy" is the new operation name.

#### 4639 6.5 Attribute Groups

4640 Attribute groups passed in requests and responses may be registered following the type2 procedures  
4641 described in Section 6.1. The tags that identify each of the attribute groups are assigned in [IPP-PRO].

4642 For attribute groups, the IPP Designated Expert in consultation with IANA assigns the next attribute group  
4643 tag code in the appropriate range as specified in [IPP-PRO]. IANA will publish approved attribute group  
4644 registration specifications as separate files:

4645         ftp.isi.edu/iana/assignments/ipp/attribute-group-tags/xxx-yyy-tag.txt

4646 where 'xxx-yyy-tag' is the new attribute group tag name.

#### 4647 6.6 Status Code Extensibility

4648 Operation status codes may also be registered following the type2 procedures described in Section 6.1. The  
4649 values for status codes are allocated in ranges as specified in Section 14 for each status code class:

4650         "informational" - Request received, continuing process  
4651         "successful" - The action was successfully received, understood, and accepted  
4652         "redirection" - Further action must be taken in order to complete the request  
4653         "client-error" - The request contains bad syntax or cannot be fulfilled

4654 "server-error" - The IPP object failed to fulfill an apparently valid request

4655

4656 For private (unregistered) operation status code extensions, implementers MUST use the top of each range  
4657 as specified in Section 13.

4658 For operation status codes, the IPP Designated Expert in consultation with IANA assigns the next status  
4659 code in the appropriate class range as specified in Section 13. IANA will publish approved status code  
4660 registration specifications as separate files:

4661 ftp.isi.edu/iana/assignments/ipp/status-codes/xxx-yyy.txt

4662 where "xxx-yyy" is the new operation status code keyword.

### 4663 6.7 Registration of MIME types/sub-types for document-formats

4664 The "document-format" attribute's syntax is 'mimeMediaType'. This means that valid values are Internet  
4665 Media Types (see Section 4.1.9). RFC 2045 [RFC2045] defines the syntax for valid Internet media types.  
4666 IANA is the registry for all Internet media types.

### 4667 6.8 Registration of charsets for use in 'charset' attribute values

4668 The "attributes-charset" attribute's syntax is 'charset'. This means that valid values are charsets names.  
4669 When a charset in the IANA registry has more than one name (alias), the name labeled as "(preferred  
4670 MIME name)", if present, MUST be used (see Section 4.1.7). IANA is the registry for charsets following  
4671 the procedures of [RFC2278].

## 4672 7. Internationalization Considerations

4673 Some of the attributes have values that are text strings and names which are intended for human  
4674 understanding rather than machine understanding (see the 'text' and 'name' attribute syntaxes in Sections  
4675 4.1.1 and 4.1.2).

4676 In each operation request, the client

- 4677 - identifies the charset and natural language of the request which affects each supplied 'text' and 'name'  
4678 attribute value, and
- 4679 - requests the charset and natural language for attributes returned by the IPP object in operation  
4680 responses (as described in Section 3.1.4.1).

4681

4682 In addition, the client MAY separately and individually identify the Natural Language Override of a  
4683 supplied 'text' or 'name' attribute using the 'textWithLanguage' and 'nameWithLanguage' technique  
4684 described section 4.1.1.2 and 4.1.2.2 respectively.

4685 All IPP objects MUST support the UTF-8 [\[RFC2044\]](#)[\[RFC2279\]](#) charset in all 'text' and 'name' attributes  
4686 supported. If an IPP object supports more than the UTF-8 charset, the object MUST convert between them  
4687 in order to return the requested charset to the client according to Section 3.1.4.2. If an IPP object supports  
4688 more than one natural language, the object SHOULD return 'text' and 'name' values in the natural language  
4689 requested where those values are generated by the Printer (see Section 3.1.4.1).

4690 For Printers that support multiple charsets and/or multiple natural languages in 'text' and 'name' attributes,  
4691 different jobs may have been submitted in differing charsets and/or natural languages. All responses MUST  
4692 be returned in the charset requested by the client. However, the Get-Jobs operation uses the  
4693 'textWithLanguage' and 'nameWithLanguage' mechanism to identify the differing natural languages with  
4694 each job attribute returned.

4695 The Printer object also has configured charset and natural language attributes. The client can query the  
4696 Printer object to determine the list of charsets and natural languages supported by the Printer object and  
4697 what the Printer object's configured values are. See the "charset-configured", "charset-supported", "natural-  
4698 language-configured", and "generated-natural-language-supported" Printer description attributes for more  
4699 details.

4700 The "charset-supported" attributed identifies the supported charsets. If a charset is supported, the IPP  
4701 object MUST be capable of converting to and from that charset into any other supported charset. In many  
4702 cases, an IPP object will support only one charset and it MUST be the UTF-8 charset.

4703 The "charset-configured" attribute identifies the one supported charset which is the native charset given the  
4704 current configuration of the IPP object (administrator defined).

4705 The "generated-natural-language-supported" attribute identifies the set of supported natural languages for  
4706 generated messages; it is not related to the set of natural languages that must be accepted for client supplied  
4707 'text' and 'name' attributes. For client supplied 'text' and 'name' attributes, an IPP object MUST accept ALL  
4708 supplied natural languages. Just because a Printer object is currently configured to support 'en-us' natural  
4709 language does not mean that the Printer object should reject a job if the client supplies a job name that is in  
4710 'fr-ca'.

4711 The "natural-language-configured" attribute identifies the one supported natural language for generated  
4712 messages which is the native natural language given the current configuration of the IPP object  
4713 (administrator defined).

4714 Attributes of type 'text' and 'name' are populated from different sources. These attributes can be categorized  
4715 into following groups (depending on the source of the attribute):

- 4716 1. Some attributes are supplied by the client (e.g., the client supplied "job-name", "document-name",  
4717 and "requesting-user-name" operation attributes along with the corresponding Job object's "job-  
4718 name" and "job-originating-user-name" attributes). The IPP object MUST accept these attributes in  
4719 any natural language no matter what the set of supported languages for generated messages
- 4720 2. Some attributes are supplied by the system administrator (e.g., the Printer object's "printer-name" and  
4721 "printer-location" attributes). These too can be in any natural language. If the natural language for  
4722 these attributes is different than what a client requests, then they must be reported using the Natural  
4723 Language Override mechanism.

- 4724 3. Some attributes are supplied by the device manufacturer (e.g., the Printer object's "printer-make-and-  
 4725 model" attribute). These too can be in any natural language. If the natural language for these  
 4726 attributes is different than what a client requests, then they must be reported using the Natural  
 4727 Language Override mechanism.
- 4728 4. Some attributes are supplied by the operator (e.g., the Job object's "job-message-from-operator"  
 4729 attribute). These too can be in any natural language. If the natural language for these attributes is  
 4730 different than what a client requests, then they must be reported using the Natural Language  
 4731 Override mechanism.
- 4732 5. Some attributes are generated by the IPP object (e.g., the Job object's "job-state-message" attribute,  
 4733 the Printer object's "printer-state-message" attribute, and the "status-message" operation attribute).  
 4734 These attributes can only be in one of the "generated-natural-language-supported" natural  
 4735 languages. If a client requests some natural language for these attributes other than one of the  
 4736 supported values, the IPP object SHOULD respond using the value of the "natural-language-  
 4737 configured" attribute (using the Natural Language Override mechanism if needed).  
 4738

4739 The 'text' and 'name' attributes specified in this version of this document (additional ones will be registered  
 4740 according to the procedures in Section 1.1) are:

Attributes	Source
Operation Attributes:	
job-name (name)	client
document-name (name)	client
requesting-user-name (name)	client
status-message	Job or Printer object
Job Template Attributes:	
job-hold-until (keyword   name)	client matches administrator-configured
job-hold-until-default (keyword   name)	client matches administrator-configured
job-hold-until-supported (keyword   name)	client matches administrator-configured
job-sheets (keyword   name)	client matches administrator-configured
job-sheets-default (keyword   name)	client matches administrator-configured
job-sheets-supported (keyword   name)	client matches administrator-configured
media (keyword   name)	client matches administrator-configured
media-default (keyword   name)	client matches administrator-configured
media-supported (keyword   name)	client matches administrator-configured
media-ready (keyword   name)	client matches administrator-configured
Job Description Attributes:	
job-name (name)	client or Printer object
job-originating-user-name (name)	Printer object
job-state-message (text)	Job or Printer object
output-device-assigned (name(127))	administrator
job-message-from-operator (text(127))	operator

Printer Description Attributes:		
	printer-name (name(127))	administrator
	printer-location (text(127))	administrator
	printer-info (text(127))	administrator
	printer-make-and-model (text(127))	administrator or manufacturer
	printer-state-message (text)	Printer object
	printer-message-from-operator (text(127))	operator

4741 8. Security Considerations

4742 ~~Some IPP objects MAY be deployed over protocol stacks that support Secure Socket Layer Version 3~~  
 4743 ~~(SSL3) [SSL]. Note: SSL3 is not an IETF standards track specification. Other IPP objects MAY be~~  
 4744 ~~deployed over protocol stacks that do not support SSL3. Some IPP objects MAY be deployed over both~~  
 4745 ~~types of protocol stacks. Those IPP objects that support SSL3, are capable of supporting mutual~~  
 4746 ~~authentication as well as privacy of messages via multiple encryption schemes. An important point about~~  
 4747 ~~security related information for SSL3 access to an IPP object, is that the security related parameters~~  
 4748 ~~(authentication, encryption keys, etc.) are "out of band" to the actual IPP protocol.~~

4749 ~~An IPP object that does not support SSL3 MAY elect to support a transport layer that provides other~~  
 4750 ~~security mechanisms. For example, in a mapping of IPP over HTTP/1.1 [IPP-PRO], if the IPP object does~~  
 4751 ~~not support SSL3, HTTP still allows for client authentication using Digest Access Authentication (DAA)~~  
 4752 ~~[RFC2069].~~

4753 It is difficult to anticipate the security risks that might exist in any given IPP environment. For example, if  
 4754 IPP is used within a given corporation over a private network, the risks of exposing document data may be  
 4755 low enough that the corporation will choose not to use encryption on that data. However, if the connection  
 4756 between the client and the IPP object is over a public network, the client may wish to protect the content of  
 4757 the information during transmission through the network with encryption.

4758 Furthermore, the value of the information being printed may vary from one IPP environment to the next.  
 4759 Printing payroll checks, for example, would have a different value than printing public information from a  
 4760 file. There is also the possibility of denial-of-service attacks, but denial-of-service attacks against printing  
 4761 resources are not well understood and there is no published precedents regarding this scenario.

4762 Once the authenticated identity of the requester has been supplied to the IPP object, the object uses that  
 4763 identity to enforce any authorization policy that might be in place. For example, one site's policy might be  
 4764 that only the job owner is allowed to cancel a job. The details and mechanisms to set up a particular access  
 4765 control policy are not part of ~~IPP/1.0, IPP/1.1~~, and must be established via some other type of administrative  
 4766 or access control framework. However, there are operation status codes that allow an IPP server to return  
 4767 information back to a client about any potential access control violations for an IPP object.

4768 During a create operation, the client's identity is recorded in the Job object in an implementation-defined  
 4769 attribute. This information can be used to verify a client's identity for subsequent operations on that Job

4770 object in order to enforce any access control policy that might be in effect. See section 8.3 below for more  
4771 details.

4772 Since the security levels or the specific threats that any given IPP system administrator may be concerned  
4773 with cannot be anticipated, IPP MUST be capable of operating with different security mechanisms and  
4774 security policies as required by the individual installation. Security policies might vary from very strong, to  
4775 very weak, to none at all, and corresponding security mechanisms will be required. ~~SSL3 supports the type  
4776 of negotiated levels of security required by most, if not all, potential IPP environments. IPP environments  
4777 that require no security can elect to deploy IPP objects that do not utilize the optional SSL3 security  
4778 mechanisms.~~

## 4779 8.1 Security Scenarios

4780 The following sections describe specific security attacks for IPP environments. Where examples are  
4781 provided they should be considered illustrative of the environment and not an exhaustive set. Not all of  
4782 these environments will necessarily be addressed in initial implementations of IPP.

### 4783 8.1.1 Client and Server in the Same Security Domain

4784 This environment is typical of internal networks where traditional office workers print the output of  
4785 personal productivity applications on shared work-group printers, or where batch applications print their  
4786 output on large production printers. Although the identity of the user may be trusted in this environment, a  
4787 user might want to protect the content of a document against such attacks as eavesdropping, replaying or  
4788 tampering.

### 4789 8.1.2 Client and Server in Different Security Domains

4790 Examples of this environment include printing a document created by the client on a publicly available  
4791 printer, such as at a commercial print shop; or printing a document remotely on a business associate's  
4792 printer. This latter operation is functionally equivalent to sending the document to the business associate as  
4793 a facsimile. Printing sensitive information on a Printer in a different security domain requires strong  
4794 security measures. In this environment authentication of the printer is required as well as protection against  
4795 unauthorized use of print resources. Since the document crosses security domains, protection against  
4796 eavesdropping and document tampering are also required. It will also be important in this environment to  
4797 protect Printers against "spamming" and malicious document content.

### 4798 8.1.3 Print by Reference

4799 When the document is not stored on the client, printing can be done by reference. That is, the print request  
4800 can contain a reference, or pointer, to the document instead of the actual document itself ([see sections 3.2.2  
4801 and 3.3.2](#)). Standard methods currently do not exist for remote entities to "assume" the credentials of a  
4802 client for forwarding requests to a 3rd party. It is anticipated that Print-By-Reference will be used to access  
4803 "public" documents and that sophisticated methods for authenticating "proxies" ~~will not be specified for  
4804 version 1 of IPP.~~ [is not specified in this document.](#)

4805 8.2 URIs ~~for SSL3 and non-SSL3 Access~~ in Operation, Job, and Printer attributes

4806 ~~As described earlier, an IPP object can support SSL3 access, non-SSL3 access, or both.~~ The "printer-uri-  
4807 supported" attribute contains the Printer object's URI(s). Its companion attribute, "uri-security-supported",  
4808 identifies the security mechanism used for each URI listed in the "printer-uri-supported" attribute. For each  
4809 Printer operation request, a client MUST supply only one URI in the "printer-uri" operation attribute. In  
4810 other words, even though the Printer supports more than one URI, the client only interacts with the Printer  
4811 object using one of its URIs. This duality is not needed for Job objects, since the Printer object is the  
4812 factory for Job objects, and the Printer object will generate the correct URI for new Job objects depending  
4813 on the Printer object's security configuration.

4814 8.3 URIs for each authentication mechanisms ~~The "requesting-user-name" (name(MAX)) Operation~~  
4815 Attribute

4816 Each URI has an authentication mechanism associated with it. If the URI is the i'th element of "printer-uri-  
4817 supported", then authentication mechanism is the "i th" element of "uri-authentication-supported". For a list  
4818 of possible authentication mechanisms, see section 4.4.2.

4819 The Printer object uses an authentication mechanism to determine the name of the user performing an  
4820 operation. This user is called the "authenticated user". The credibility of authentication depends on the  
4821 mechanism that the Printer uses to obtain the user's name. When the authentication mechanism is 'none', all  
4822 authenticated users are "anonymous".

4823 During job creation operations, the Printer initializes the value of the "job-originating-user-name" attribute  
4824 (see section 4.3.6) to be the authenticated user. The authenticated user in this case is called the "job-owner".

4825 If an implementation can be configured to support more than one authentication mechanism, then it MUST  
4826 implement rules for determining equality of authenticated user names which have been authenticated via  
4827 different authentication mechanisms. One possible policy is that identical names that are authenticated via  
4828 different mechanism are different. For example, a user can cancel his job only if he uses the same  
4829 authentication mechanism for both Cancel-Job and Print-Job. Another policy is that identical names that  
4830 are authenticated via different mechanism are the same if the authentication mechanism for the later  
4831 operation is not less strong than the authentication mechanism for the earlier job creation operation. For  
4832 example, a user can cancel his job only if he uses the same or stronger authentication mechanism for  
4833 Cancel-Job and Print-Job. With this second policy a job submitted via 'requesting-user-name' authentication  
4834 could be cancelled via 'digest' authentication. With the first policy, the job could not be cancelled in this  
4835 way.

4836 A client is able to determine the authentication mechanism used to create a job. It is the i'th value of the  
4837 Printer's "uri-authentication-supported" attribute (see section 4.4.2), where i is the index of the element of  
4838 the Printer's "printer-uri-supported" attribute (see section 4.4.1) equal to the job's "job-printer-uri" attribute  
4839 (see section 4.3.3).

4840 Each operation MUST specify the user who is performing the operation in both of the following two ways:

4841 ~~1.31) via the REQUIRED "requesting-user-name" operation attribute that a client SHOULD supply in all~~  
4842 ~~operations. The client MUST obtain the value for this attribute from an environmental or network login~~  
4843 ~~name for the user, rather than allowing the user to supply any value. If the client does not supply a value for~~  
4844 ~~"requesting-user-name", the printer MUST assume that the client is supplying some anonymous name, such~~  
4845 ~~as "anonymous".~~

4846 ~~2) via an authentication mechanism of the underlying transport which may be configured to give no~~  
4847 ~~authentication information.~~

4848

4849 ~~There are six cases to consider:~~

- 4850 ~~a) the authentication mechanism gives no information, and the client doesn't specify "requesting-user-~~  
4851 ~~name".~~
- 4852 ~~b) the authentication mechanism gives no information, but the client specifies "requesting-user-name".~~
- 4853 ~~c) the authentication mechanism specifies a user which has no human readable representation, and the~~  
4854 ~~client doesn't specify "requesting-user-name".~~
- 4855 ~~d) the authentication mechanism specifies a user which has no human readable representation, but the~~  
4856 ~~client specifies "requesting-user-name".~~
- 4857 ~~e) the authentication mechanism specifies a user which has a human readable representation. The~~  
4858 ~~Printer object ignores the "requesting-user-name".~~
- 4859 ~~f) the authentication mechanism specifies a user who is trusted and whose name means that the value of~~  
4860 ~~the "requesting-user-name", which MUST be present, is treated as the authenticated name.~~

4861

4862 ~~Note: Case "f" is intended for a tightly coupled gateway and server to work together so that the "user"~~  
4863 ~~name is able to be that of the gateway client and not that of the gateway. Because most, if not all, system~~  
4864 ~~vendors will initially implement IPP via a gateway into their existing print system, this mechanism is~~  
4865 ~~necessary unless the authentication mechanism allows a gateway (client) to act on behalf of some other~~  
4866 ~~client.~~

4867 ~~The user name has two forms: one that is human readable: it is held in the REQUIRED "job-originating-~~  
4868 ~~user-name" Job Description attribute which is set during the job creation operations. It is used for~~  
4869 ~~presentation only, such as returning in queries or printing on start sheets~~

4870 ~~—one for authorization: it is held in an undefined (by IPP) Job object attribute which is set by the job~~  
4871 ~~creation operation. It is used to authorize other operations, such as Send Document, Send URI,~~  
4872 ~~Cancel Job, to determine the user when the "my-jobs" attribute is specified with Get Jobs, and to~~  
4873 ~~limit what attributes and values to return with Get Job Attributes and Get Jobs.~~

4874

4875 ~~The human readable user name:~~

- 4876 ~~—is the value of the "requesting-user-name" for cases b, d and f.~~
- 4877 ~~—comes from the authentication mechanism for case e~~
- 4878 ~~—is some anonymous name, such as "anonymous" for cases a and c.~~

4879

4880 ~~The user name used for authorization:~~

- 4881 ~~— is the value of the "requesting-user-name" for cases b and f.~~
- 4882 ~~— comes from the authentication mechanism for cases c, d and e~~
- 4883 ~~— is some anonymous name, such as "anonymous" for case a.~~

4884

4885 ~~The essence of these rules for resolving conflicting sources of user names is that a printer implementation is~~  
4886 ~~free to pick either source as long as it achieves consistent results. That is, if a user uses the same path for a~~  
4887 ~~series of requests, the requests MUST appear to come from the same user from the standpoint of both the~~  
4888 ~~human readable user name and the user name for authorization. This rule MUST continue to apply even if~~  
4889 ~~a request could be authenticated by two or more mechanisms. It doesn't matter which of several~~  
4890 ~~authentication mechanisms a Printer uses as long as it achieves consistent results. If a client uses more than~~  
4891 ~~one authentication mechanism, it is recommended that an administrator make all credentials resolve to the~~  
4892 ~~same user and user name as much as possible.~~

#### 4893 8.4 Restricted Queries

4894 In many IPP operations, a client supplies a list of attributes to be returned in the response. For security  
4895 reasons, an IPP object may be configured not to return all attributes (or all values) that a client requests.  
4896 The job attributes returned MAY depend on whether the requesting user is the same as the user that  
4897 submitted the job. The IPP object MAY even return none of the requested attributes. In such cases, the  
4898 status returned is the same as if the object had returned all requested attributes. The client cannot tell by  
4899 such a response whether the requested attribute was present or absent on the object.

#### 4900 8.5 Operations performed by operators and system administrators

4901 For the three printer operations Pause-Printer, Resume-Printer, and Purge-Jobs (see sections 3.2.7, 3.2.8 and  
4902 3.2.9), the requesting user is intended to be an operator or administrator of the Printer object (see section 1).  
4903 For operations on jobs, the requesting user is intended to be the job owner or may be an operator or  
4904 administrator of the Printer object. The means for authorizing an operator or administrator of the Printer  
4905 object are not specified in this document.

#### 4906 8.6 Queries on jobs submitted using non-IPP protocols

4907 If the device that an IPP Printer is representing is able to accept jobs using other job submission protocols  
4908 in addition to IPP, it is RECOMMENDED that such an implementation at least allow such "foreign" jobs to  
4909 be queried using Get-Jobs returning "job-id" and "job-uri" as 'unknown'. Such an implementation NEED  
4910 NOT support all of the same IPP job attributes as for IPP jobs. The IPP object returns the 'unknown' out-of-  
4911 band value for any requested attribute of a foreign job that is supported for IPP jobs, but not for foreign  
4912 jobs.

4913 It is further RECOMMENDED, that the IPP Printer generate "job-id" and "job-uri" values for such "foreign  
4914 jobs", if possible, so that they may be targets of other IPP operations, such as Get-Job-Attributes and  
4915 Cancel-Job. Such an implementation also needs to deal with the problem of authentication of such foreign  
4916 jobs. One approach would be to treat all such foreign jobs as belonging to users other than the user of the

4917 IPP client. Another approach would be for the foreign job to belong to 'anonymous'. Only if the IPP client  
4918 has been authenticated as an operator or administrator of the IPP Printer object, could the foreign jobs be  
4919 queried by an IPP request. Alternatively, if the security policy is to allow users to query other users' jobs,  
4920 then the foreign jobs would also be visible to an end-user IPP client using Get-Jobs and Get-Job-Attributes.

## 4921 ~~8.6 IPP Security Application Profile for SSL3~~

4922 ~~The IPP application profile for SSL3 follows the "Secure Socket Layer" requirement as documented in the~~  
4923 ~~SSL3 specification [SSL]. For interoperability, the SSL3 cipher suites are:~~

4924 ~~SSL\_RSA\_WITH\_RC4\_128\_MD5~~  
4925 ~~SSL\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA~~  
4926 ~~SSL\_RSA\_WITH\_DES\_CBC\_SHA~~  
4927 ~~SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5~~  
4928 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5~~  
4929 ~~SSL\_RSA\_WITH\_NULL\_MD5~~

4930 ~~Client implementations MUST NOT assume any other cipher suites are supported by an IPP Printer object.~~

4931 ~~If a conforming IPP object supports SSL3, it MUST implement and support the cipher suites listed above~~  
4932 ~~and MAY support additional cipher suites.~~

4933 ~~A conforming IPP client SHOULD support SSL3 including the cipher suites listed above. A conforming~~  
4934 ~~IPP client MAY support additional cipher suites.~~

4935 ~~It is possible that due to certain government export restrictions some non-compliant versions of this~~  
4936 ~~extension could be deployed. Implementations wishing to inter-operate with such non-compliant versions~~  
4937 ~~MAY offer the SSL\_RSA\_EXPORT\_WITH\_RC4\_40\_MD5 and~~  
4938 ~~SSL\_RSA\_EXPORT\_WITH\_RC2\_CBC\_40\_MD5 mechanisms. However, since 40 bit ciphers are known~~  
4939 ~~to be vulnerable to attack by current technology, any client which activates a 40 bit cipher MUST NOT~~  
4940 ~~indicate to the user that the connection is completely secure from eavesdropping.~~

## 5203 11. Formats for IPP Registration Proposals

5204 In order to propose an IPP extension for registration, the proposer must submit an application to IANA by  
5205 email to "iana@iana.org" or by filling out the appropriate form on the IANA web pages  
5206 (http://www.iana.org). This section specifies the required information and the formats for proposing  
5207 registrations of extensions to IPP as provided in Section 6 for:

5208

5209 1. type2 'keyword' attribute values

5210 2. type3 'keyword' attribute values

5211 3. type2 'enum' attribute values

5212 4. type3 'enum' attribute values

5213 5. attributes

5214 6. attribute syntaxes

5215 7. operations

5216 8. status codes

## 5217 11.1 Type2 keyword attribute values registration

5218 Type of registration: type2 keyword attribute value

5219 Name of attribute to which this keyword specification is to be added:

5220 Proposed keyword name of this keyword value:

5221 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5222 Name of proposer:

5223 Address of proposer:

5224 Email address of proposer:

5225

5226 Note: For type2 keywords, the Designated Expert will be the point of contact for the approved registration  
5227 specification, if any maintenance of the registration specification is needed.

## 5228 11.2 Type3 keyword attribute values registration

5229 Type of registration: type3 keyword attribute value

5230 Name of attribute to which this keyword specification is to be added:

5231 Proposed keyword name of this keyword value:

5232 Specification of this keyword value (follow the style of IPP Model Section 4.1.2.3):

5233 Name of proposer:

5234 Address of proposer:

5235 Email address of proposer:

5236

5237 Note: For type3 keywords, the proposer will be the point of contact for the approved registration  
5238 specification, if any maintenance of the registration specification is needed.

## 5239 11.3 Type2 enum attribute values registration

5240 Type of registration: type2 enum attribute value

- 5241 Name of attribute to which this enum specification is to be added:  
5242 Keyword symbolic name of this enum value:  
5243 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5244 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5245 Name of proposer:  
5246 Address of proposer:  
5247 Email address of proposer:  
5248  
5249 Note: For type2 enums, the Designated Expert will be the point of contact for the approved registration  
5250 specification, if any maintenance of the registration specification is needed.
- 5251 11.4 Type3 enum attribute values registration
- 5252 Type of registration: type3 enum attribute value  
5253 Name of attribute to which this enum specification is to be added:  
5254 Keyword symbolic name of this enum value:  
5255 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):  
5256 Specification of this enum value (follow the style of IPP Model Section 4.1.4):  
5257 Name of proposer:  
5258 Address of proposer:  
5259 Email address of proposer:  
5260  
5261 Note: For type3 enums, the proposer will be the point of contact for the approved registration specification,  
5262 if any maintenance of the registration specification is needed.
- 5263 11.5 Attribute registration
- 5264 Type of registration: attribute  
5265 Proposed keyword name of this attribute:  
5266 Types of attribute (Operation, Job Template, Job Description, Printer Description):  
5267 Operations to be used with if the attribute is an operation attribute:  
5268 Object (Job, Printer, etc. if bound to an object):  
5269 Attribute syntax(es) (include 1setOf and range as in Section 4.2):  
5270 If attribute syntax is 'keyword' or 'enum', is it type2 or type3:  
5271 If this is a Printer attribute, MAY the value returned depend on "document-format" (See Section 6.2):  
5272 If this is a Job Template attribute, how does its specification depend on the value of the "multiple-  
5273 document-handling" attribute:  
5274 Specification of this attribute (follow the style of IPP Model Section 4.2):  
5275 Name of proposer:  
5276 Address of proposer:  
5277 Email address of proposer:  
5278  
5279 Note: For attributes, the IPP Designated Expert will be the point of contact for the approved registration  
5280 specification, if any maintenance of the registration specification is needed.

## 5281 11.6 Attribute Syntax registration

5282 Type of registration: attribute syntax

5283 Proposed name of this attribute syntax:

5284 Type of attribute syntax (integer, octetString, character-string, see [IPP-PRO]):

5285 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5286 Specification of this attribute (follow the style of IPP Model Section 4.1):

5287 Name of proposer:

5288 Address of proposer:

5289 Email address of proposer:

5290

5291 Note: For attribute syntaxes, the IPP Designated Expert will be the point of contact for the approved  
5292 registration specification, if any maintenance of the registration specification is needed.

## 5293 11.7 Operation registration

5294 Type of registration: operation

5295 Proposed name of this operation:

5296 Numeric operation-id value (to be assigned by the IPP Designated Expert in consultation with IANA):

5297 Object Target (Job, Printer, etc. that operation is upon):

5298 Specification of this attribute (follow the style of IPP Model Section 3):

5299 Name of proposer:

5300 Address of proposer:

5301 Email address of proposer:

5302

5303 Note: For operations, the IPP Designated Expert will be the point of contact for the approved registration  
5304 specification, if any maintenance of the registration specification is needed.

## 5305 11.8 Attribute Group registration

5306 Type of registration: attribute group

5307 Proposed name of this attribute group:

5308 Numeric tag according to [IPP-PRO] (to be assigned by the IPP Designated Expert in consultation with  
5309 IANA):

5310 Operation requests and group number for each operation in which the attribute group occurs:

5311 Operation responses and group number for each operation in which the attribute group occurs:

5312 Specification of this attribute group (follow the style of IPP Model Section 3):

5313 Name of proposer:

5314 Address of proposer:

5315 Email address of proposer:

5316

5317 Note: For attribute groups, the IPP Designated Expert will be the point of contact for the approved  
5318 registration specification, if any maintenance of the registration specification is needed.

## 5319 11.9 Status code registration

5320 Type of registration: status code

5321 Keyword symbolic name of this status code value:

5322 Numeric value (to be assigned by the IPP Designated Expert in consultation with IANA):

5323 Operations that this status code may be used with:

5324 Specification of this status code (follow the style of IPP Model Section 13 APPENDIX B: Status Codes  
5325 and Suggested Status Code Messages):

5326 Name of proposer:

5327 Address of proposer:

5328 Email address of proposer:

5329

5330 Note: For status codes, the Designated Expert will be the point of contact for the approved registration  
5331 specification, if any maintenance of the registration specification is needed.

## 5332 12. APPENDIX A: Terminology

5333 This specification [document](#) uses the terminology defined in this section.

## 5334 12.1 Conformance Terminology

5335 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT",  
5336 "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in  
5337 RFC 2119 [RFC2119].

## 5338 12.1.1 NEED NOT

5339 This term is not included in RFC 2119. The verb "NEED NOT" indicates an action that the subject of the  
5340 sentence does not have to implement in order to claim conformance to the standard. The verb "NEED  
5341 NOT" is used instead of "MAY NOT" since "MAY NOT" sounds like a prohibition.

## 5342 12.2 Model Terminology

## 5343 12.2.1 Keyword

5344 Keywords are used within this document as identifiers of semantic entities within the abstract model (see  
5345 section 4.1.2.3). Attribute names, some attribute values, attribute syntaxes, and attribute group names are  
5346 represented as keywords.

## 5347 12.2.2 Attributes

5348 An attribute is an item of information that is associated with an instance of an IPP object. An attribute  
5349 consists of an attribute name and one or more attribute values. Each attribute has a specific attribute syntax.  
5350 All object attributes are defined in section 4 and all operation attributes are defined in section 3.

5351 Job Template Attributes are described in section 4.2. The client optionally supplies Job Template attributes  
5352 in a create request (operation requests that create Job objects). The Printer object has associated attributes  
5353 which define supported and default values for the Printer.

## 5354 12.2.2.1 Attribute Name

5355 Each attribute is uniquely identified in this document by its attribute name. An attribute name is a keyword.  
5356 The keyword attribute name is given in the section header describing that attribute. In running text in this  
5357 document, attribute names are indicated inside double quotation marks (") where the quotation marks are  
5358 not part of the keyword itself.

## 5359 12.2.2.2 Attribute Group Name

5360 Related attributes are grouped into named groups. The name of the group is a keyword. The group name  
5361 may be used in place of naming all the attributes in the group explicitly. Attribute groups are defined in  
5362 section 3.

## 5363 12.2.2.3 Attribute Value

5364 Each attribute has one or more values. Attribute values are represented in the syntax type specified for that  
5365 attribute. In running text in this document, attribute values are indicated inside single quotation marks ('),  
5366 whether their attribute syntax is keyword, integer, text, etc. where the quotation marks are not part of the  
5367 value itself.

## 5368 12.2.2.4 Attribute Syntax

5369 Each attribute is defined using an explicit syntax type. In this document, each syntax type is defined as a  
5370 keyword with specific meaning. The ~~Encoding and Transport~~ "Encoding and Transport" document [IPP-  
5371 PRO] indicates the actual "on-the-wire" encoding rules for each syntax type. Attribute syntax types are  
5372 defined in section 4.1.

## 5373 12.2.3 Supports

5374 By definition, a Printer object supports an attribute only if that Printer object responds with the  
5375 corresponding attribute populated with some value(s) in a response to a query for that attribute. A Printer  
5376 object supports an attribute value if the value is one of the Printer object's "supported values" attributes.  
5377 The device behind a Printer object may exhibit a behavior that corresponds to some IPP attribute, but if the  
5378 Printer object, when queried for that attribute, doesn't respond with the attribute, then as far as IPP is  
5379 concerned, that implementation does not support that feature. If the Printer object's "xxx-supported"

5380 attribute is not populated with a particular value (even if that value is a legal value for that attribute), then  
5381 that Printer object does not support that particular value.

5382 A conforming implementation MUST support all REQUIRED attributes. However, even for REQUIRED  
5383 attributes, conformance to IPP does not mandate that all implementations support all possible values  
5384 representing all possible job processing behaviors and features. For example, if a given instance of a  
5385 Printer supports only certain document formats, then that Printer responds with the "document-format-  
5386 supported" attribute populated with a set of values, possibly only one, taken from the entire set of possible  
5387 values defined for that attribute. This limited set of values represents the Printer's set of supported  
5388 document formats. Supporting an attribute and some set of values for that attribute enables IPP end users to  
5389 be aware of and make use of those features associated with that attribute and those values. If an  
5390 implementation chooses to not support an attribute or some specific value, then IPP end users would have  
5391 no ability to make use of that feature within the context of IPP itself. However, due to existing practice and  
5392 legacy systems which are not IPP aware, there might be some other mechanism outside the scope of IPP to  
5393 control or request the "unsupported" feature (such as embedded instructions within the document data  
5394 itself).

5395 For example, consider the "finishings-supported" attribute.

- 5396 1) If a Printer object is not physically capable of stapling, the "finishings-supported" attribute MUST  
5397 NOT be populated with the value of 'staple'.
- 5398 2) A Printer object is physically capable of stapling, however an implementation chooses not to support  
5399 stapling in the IPP "finishings" attribute. In this case, 'staple' MUST NOT be a value in the  
5400 "finishings-supported" Printer object attribute. Without support for the value 'staple', an IPP end  
5401 user would have no means within the protocol itself to request that a Job be stapled. However, an  
5402 existing document data formatter might be able to request that the document be stapled directly with  
5403 an embedded instruction within the document data. In this case, the IPP implementation does not  
5404 "support" stapling, however the end user is still able to have some control over the stapling of the  
5405 completed job.
- 5406 3) A Printer object is physically capable of stapling, and an implementation chooses to support stapling  
5407 in the IPP "finishings" attribute. In this case, 'staple' MUST be a value in the "finishings-supported"  
5408 Printer object attribute. Doing so, would enable end users to be aware of and make use of the  
5409 stapling feature using IPP attributes.

5410  
5411 Even though support for Job Template attributes by a Printer object is OPTIONAL, it is RECOMMENDED  
5412 that if the device behind a Printer object is capable of realizing any feature or function that corresponds to  
5413 an IPP attribute and some associated value, then that implementation SHOULD support that IPP attribute  
5414 and value.

5415 The set of values in any of the supported value attributes is set (populated) by some administrative process  
5416 or automatic sensing mechanism that is outside the scope of [IPP-this IPP/1.1 document](#). For administrative  
5417 policy and control reasons, an administrator may choose to make only a subset of possible values visible to  
5418 the end user. In this case, the real output device behind the IPP Printer abstraction may be capable of a  
5419 certain feature, however an administrator is specifying that access to that feature not be exposed to the end  
5420 user through the IPP protocol. Also, since a Printer object may represent a logical print device (not just a  
5421 physical device) the actual process for supporting a value is undefined and left up to the implementation.

5422 However, if a Printer object supports a value, some manual human action may be needed to realize the  
5423 semantic action associated with the value, but no end user action is required.

5424 For example, if one of the values in the "finishings-supported" attribute is 'staple', the actual process might  
5425 be an automatic staple action by a physical device controlled by some command sent to the device. Or, the  
5426 actual process of stapling might be a manual action by an operator at an operator attended Printer object.

5427 For another example of how supported attributes function, consider a system administrator who desires to  
5428 control all print jobs so that no job sheets are printed in order to conserve paper. To force no job sheets, the  
5429 system administrator sets the only supported value for the "job-sheets-supported" attribute to 'none'. In this  
5430 case, if a client requests anything except 'none', the create request is rejected or the "job-sheets" value is  
5431 ignored (depending on the value of "ipp-attribute-fidelity"). To force the use of job start/end sheets on all  
5432 jobs, the administrator does not include the value 'none' in the "job-sheets-supported" attribute. In this case,  
5433 if a client requests 'none', the create request is rejected or the "job-sheets" value is ignored (again depending  
5434 on the value of "ipp-attribute-fidelity").

#### 5435 12.2.4 print-stream page

5436 A "print-stream page" is a page according to the definition of pages in the language used to express the  
5437 document data.

#### 5438 12.2.5 impression

5439 An "impression" is the image (possibly many print-stream pages in different configurations) imposed onto a  
5440 single media page.

### 5441 13. APPENDIX B: Status Codes and Suggested Status Code Messages

5442 This section defines status code enum keywords and values that are used to provide semantic information  
5443 on the results of an operation request. Each operation response **MUST** include a status code. The response  
5444 **MAY** also contain a status message that provides a short textual description of the status. The status code  
5445 is intended for use by automata, and the status message is intended for the human end user. Since the status  
5446 message is an **OPTIONAL** component of the operation response, an IPP application (i.e., a browser, GUI,  
5447 print driver or gateway) is **NOT REQUIRED** to examine or display the status message, since it **MAY** not be  
5448 returned to the application.

5449 The prefix of the status keyword defines the class of response as follows:

- 5450 "informational" - Request received, continuing process
- 5451 "successful" - The action was successfully received, understood, and accepted
- 5452 "redirection" - Further action must be taken in order to complete the request
- 5453 "client-error" - The request contains bad syntax or cannot be fulfilled
- 5454 "server-error" - The IPP object failed to fulfill an apparently valid request

5455

5456 As with type2 enums, IPP status codes are extensible. IPP clients are NOT REQUIRED to understand the  
5457 meaning of all registered status codes, though such understanding is obviously desirable. However, IPP  
5458 clients MUST understand the class of any status code, as indicated by the prefix, and treat any unrecognized  
5459 response as being equivalent to the first status code of that class, with the exception that an unrecognized  
5460 response MUST NOT be cached. For example, if an unrecognized status code of "client-error-xxx-yyy" is  
5461 received by the client, it can safely assume that there was something wrong with its request and treat the  
5462 response as if it had received a "client-error-bad-request" status code. In such cases, IPP applications  
5463 SHOULD present the OPTIONAL message (if present) to the end user since the message is likely to  
5464 contain human readable information which will help to explain the unusual status. The name of the enum  
5465 is the suggested status message for US English.

5466 The status code values range from 0x0000 to 0x7FFF. The value ranges for each status code class are as  
5467 follows:

5468 "successful" - 0x0000 to 0x00FF  
5469 "informational" - 0x0100 to 0x01FF  
5470 "redirection" - 0x0200 to 0x02FF  
5471 "client-error" - 0x0400 to 0x04FF  
5472 "server-error" - 0x0500 to 0x05FF  
5473

5474 The top half (128 values) of each range (0x0n40 to 0x0nFF, for n = 0 to 5) is reserved for private use within  
5475 each status code class. Values 0x0600 to 0x7FFF are reserved for future assignment and MUST NOT be  
5476 used.

## 5477 13.1 Status Codes

5478 Each status code is described below. Section 13.1.5.9 contains a table that indicates which status codes  
5479 apply to which operations. The Implementer's Guide [IPP-IIG] describe the suggested steps for processing  
5480 IPP attributes for all operations, including returning status codes.

### 5481 13.1.1 Informational

5482 This class of status code indicates a provisional response and is to be used for informational purposes only.

5483 There are no status codes defined in ~~IPP/1.0~~[IPP/1.1](#) for this class of status code.

### 5484 13.1.2 Successful Status Codes

5485 This class of status code indicates that the client's request was successfully received, understood, and  
5486 accepted.

#### 5487 13.1.2.1 successful-ok (0x0000)

5488 The request has succeeded and no request attributes were substituted or ignored. In the case of a response  
5489 to a create request, the 'successful-ok' status code indicates that the request was successfully received and

5490 validated, and that the Job object has been created; it does not indicate that the job has been processed. The  
5491 transition of the Job object into the 'completed' state is the only indicator that the job has been printed.

#### 5492 13.1.2.2 successful-ok-ignored-or-substituted-attributes (0x0001)

5493 The request has succeeded, but some supplied (1) attributes were ignored or (2) unsupported values were  
5494 substituted with supported values or were ignored in order to perform the operation without rejecting it.  
5495 Unsupported attributes, attribute syntaxes, or values MUST be returned in the Unsupported Attributes  
5496 group of the response for all operations. There is an exception to this rule for the query operations: Get-  
5497 Printer-Attributes, Get-Jobs, and Get-Job-Attributes for the "requested-attributes" operation attribute only.  
5498 When the supplied values of the "requested-attributes" operation attribute are requesting attributes that are  
5499 not supported, the IPP object MAY, but is NOT REQUIRED to, return the "requested-attributes" attribute  
5500 in the Unsupported Attribute response group (with the unsupported values only). See sections [3.1.7](#) and  
5501 [3.2.1.2](#).

#### 5502 13.1.2.3 successful-ok-conflicting-attributes (0x0002)

5503 The request has succeeded, but some supplied attribute values conflicted with the values of other supplied  
5504 attributes. These conflicting values were either (1) substituted with (supported) values or (2) the attributes  
5505 were removed in order to process the job without rejecting it. Attributes or values which conflict with other  
5506 attributes and have been substituted or ignored MUST be returned in the Unsupported Attributes group of  
5507 the response for all operations as supplied by the client. See sections [3.1.7](#) and [3.2.1.2](#).

#### 5508 13.1.3 Redirection Status Codes

5509 This class of status code indicates that further action needs to be taken to fulfill the request.

5510 There are no status codes defined in [IPP/1.0](#) [IPP/1.1](#) for this class of status code.

#### 5511 13.1.4 Client Error Status Codes

5512 This class of status code is intended for cases in which the client seems to have erred. The IPP object  
5513 SHOULD return a message containing an explanation of the error situation and whether it is a temporary or  
5514 permanent condition.

#### 5515 13.1.4.1 client-error-bad-request (0x0400)

5516 The request could not be understood by the IPP object due to malformed syntax (such as the value of a  
5517 fixed length attribute whose length does not match the prescribed length for that attribute - see the  
5518 Implementer's Guide [IPP-IIG] ). The IPP application SHOULD NOT repeat the request without  
5519 modifications.

## 5520 13.1.4.2 client-error-forbidden (0x0401)

5521 The IPP object understood the request, but is refusing to fulfill it. Additional authentication information or  
5522 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is  
5523 commonly used when the IPP object does not wish to reveal exactly why the request has been refused or  
5524 when no other response is applicable.

## 5525 13.1.4.3 client-error-not-authenticated (0x0402)

5526 The request requires user authentication. The IPP client may repeat the request with suitable authentication  
5527 information. If the request already included authentication information, then this status code indicates that  
5528 authorization has been refused for those credentials. If this response contains the same challenge as the  
5529 prior response, and the user agent has already attempted authentication at least once, then the response  
5530 message may contain relevant diagnostic information. This status codes reveals more information than  
5531 "client-error-forbidden".

## 5532 13.1.4.4 client-error-not-authorized (0x0403)

5533 The requester is not authorized to perform the request. Additional authentication information or  
5534 authorization credentials will not help and the request SHOULD NOT be repeated. This status code is used  
5535 when the IPP object wishes to reveal that the authentication information is understandable, however, the  
5536 requester is explicitly not authorized to perform the request. This status codes reveals more information  
5537 than "client-error-forbidden" and "client-error-not-authenticated".

## 5538 13.1.4.5 client-error-not-possible (0x0404)

5539 This status code is used when the request is for something that can not happen. For example, there might  
5540 be a request to cancel a job that has already been canceled or aborted by the system. The IPP client  
5541 SHOULD NOT repeat the request.

## 5542 13.1.4.6 client-error-timeout (0x0405)

5543 The client did not produce a request within the time that the IPP object was prepared to wait. For example,  
5544 a client issued a Create-Job operation and then, after a long period of time, issued a Send-Document  
5545 operation and this error status code was returned in response to the Send-Document request (see section  
5546 3.3.1). The IPP object might have been forced to clean up resources that had been held for the waiting  
5547 additional Documents. The IPP object was forced to close the Job since the client took too long. The client  
5548 SHOULD NOT repeat the request without modifications.

## 5549 13.1.4.7 client-error-not-found (0x0406)

5550 The IPP object has not found anything matching the request URI. No indication is given of whether the  
5551 condition is temporary or permanent. For example, a client with an old reference to a Job (a URI) tries to  
5552 cancel the Job, however in the mean time the Job might have been completed and all record of it at the  
5553 Printer has been deleted. This status code, 'client-error-not-found' is returned indicating that the referenced

5554 Job can not be found. This error status code is also used when a client supplies a URI as a reference to the  
5555 document data in either a Print-URI or Send-URI operation, but the document can not be found.

5556 In practice, an IPP application should avoid a not found situation by first querying and presenting a list of  
5557 valid Printer URIs and Job URIs to the end-user.

#### 5558 13.1.4.8 client-error-gone (0x0407)

5559 The requested object is no longer available and no forwarding address is known. This condition should be  
5560 considered permanent. Clients with link editing capabilities should delete references to the request URI  
5561 after user approval. If the IPP object does not know or has no facility to determine, whether or not the  
5562 condition is permanent, the status code "client-error-not-found" should be used instead.

5563 This response is primarily intended to assist the task of maintenance by notifying the recipient that the  
5564 resource is intentionally unavailable and that the IPP object administrator desires that remote links to that  
5565 resource be removed. It is not necessary to mark all permanently unavailable resources as "gone" or to keep  
5566 the mark for any length of time -- that is left to the discretion of the IPP object administrator.

#### 5567 13.1.4.9 client-error-request-entity-too-large (0x0408)

5568 The IPP object is refusing to process a request because the request entity is larger than the IPP object is  
5569 willing or able to process. An IPP Printer returns this status code when it limits the size of print jobs and it  
5570 receives a print job that exceeds that limit or when the attributes are so many that their encoding causes the  
5571 request entity to exceed IPP object capacity.

#### 5572 13.1.4.10 client-error-request-value-too-long (0x0409)

5573 The IPP object is refusing to service the request because one or more of the client-supplied attributes has a  
5574 variable length value that is longer than the maximum length specified for that attribute. The IPP object  
5575 might not have sufficient resources (memory, buffers, etc.) to process (even temporarily), interpret, and/or  
5576 ignore a value larger than the maximum length. Another use of this error code is when the IPP object  
5577 supports the processing of a large value that is less than the maximum length, but during the processing of  
5578 the request as a whole, the object may pass the value onto some other system component which is not able  
5579 to accept the large value. For more details, see the Implementer's Guide [IPP-IIG] .

5580 Note: For attribute values that are URIs, this rare condition is only likely to occur when a client has  
5581 improperly submitted a request with long query information (e.g. an IPP application allows an end-user to  
5582 enter an invalid URI), when the client has descended into a URI "black hole" of redirection (e.g., a  
5583 redirected URI prefix that points to a suffix of itself), or when the IPP object is under attack by a client  
5584 attempting to exploit security holes present in some IPP objects using fixed-length buffers for reading or  
5585 manipulating the Request-URI.

## 5586 13.1.4.11 client-error-document-format-not-supported (0x040A)

5587 The IPP object is refusing to service the request because the document data is in a format, as specified in  
5588 the "document-format" operation attribute, that is not supported by the Printer object. This error is returned  
5589 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,  
5590 even if there are other [Job Template](#) attributes that are not supported as well, since this error is a bigger  
5591 problem than with Job Template attributes. [See sections 3.1.7 and 3.2.1.1, Issue 11](#)

## 5592 13.1.4.12 client-error-attributes-or-values-not-supported (0x040B)

5593 In a create request, if the Printer object does not support one or more attributes, attribute syntaxes, or  
5594 attribute values supplied in the request and the client supplied the "ipp-attributes-fidelity" operation  
5595 attribute with the 'true' value, the Printer object MUST return this status code. [The Printer object MUST](#)  
5596 [also return in the Unsupported Attributes Group all the attributes and/or values supplied by the client that](#)  
5597 [are not supported. See section 3.1.7, Issue 11](#) For example, if the request indicates 'iso-a4' media, but that  
5598 media type is not supported by the Printer object. Or, if the client supplies [an optional Job Template](#)  
5599 attribute and the attribute itself is not even supported by the Printer. If the "ipp-attribute-fidelity" attribute  
5600 is 'false', the Printer MUST ignore or substitute values for unsupported [Job Template](#) attributes and values  
5601 rather than reject the request and return this status code.

5602 For any operation where a client requests attributes (such as a Get-Jobs, Get-Printer-Attributes, or Get-Job-  
5603 Attributes operation), if the IPP object does not support one or more of the requested attributes, the IPP  
5604 object simply ignores the unsupported requested attributes and processes the request as if they had not been  
5605 supplied, rather than returning this status code. In this case, the IPP object MUST return the 'successful-ok-  
5606 ignored-or-substituted-attributes' status code and MAY return the unsupported attributes as values of the  
5607 "requested-attributes" in the Unsupported Attributes Group (see section 13.1.2.2).

## 5608 13.1.4.13 client-error-uri-scheme-not-supported (0x040C)

5609 The [type of the client supplied scheme of the client-supplied](#) URI in a Print-URI or a Send-URI operation is  
5610 not supported. [See section 3.1.7, Issue 11](#)

## 5611 13.1.4.14 client-error-charset-not-supported (0x040D)

5612 For any operation, if the IPP Printer does not support the charset supplied by the client in the "attributes-  
5613 charset" operation attribute, the Printer MUST reject the operation and return this status and any 'text' or  
5614 'name' attributes using the 'utf-8' charset (see Section 3.1.4.1). [See section 3.1.7, Issue 11](#)

## 5615 13.1.4.15 client-error-conflicting-attributes (0x040E)

5616 The request is rejected because some attribute values conflicted with the values of other attributes which  
5617 this [specification document](#) does not permit to be substituted or ignored. [The Printer object MUST also](#)  
5618 [return in the Unsupported Attributes Group the conflicting attributes supplied by the client. See sections](#)  
5619 [3.1.7 and 3.2.1.2, Issue 27](#)

5620 13.1.4.16 client-error-compression-not-supported (0x040F) Issue 6

5621 The IPP object is refusing to service the request because the document data, as specified in the  
5622 "compression" operation attribute, is compressed in a way that is not supported by the Printer object. This  
5623 error is returned independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return  
5624 this status code, even if there are other Job Template attributes that are not supported as well, since this  
5625 error is a bigger problem than with Job Template attributes. Issue 6 See sections 3.1.7 and 3.2.1.1. Issue 11

5626 13.1.4.17 client-error-compression-error (0x0410) Issue 6

5627 The IPP object is refusing to service the request because the document data cannot be decompressed when  
5628 using the algorithm specified by the "compression" operation attribute. This error is returned independent  
5629 of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code, even if there  
5630 are Job Template attributes that are not supported as well, since this error is a bigger problem than with Job  
5631 Template attributes. See sections 3.1.7 and 3.2.1.1.

5632 13.1.4.18 client-error-document-format-error (0x0411) Issue 28

5633 The IPP object is refusing to service the request because Printer encountered an error in the document data  
5634 while interpreting it. This error is returned independent of the client-supplied "ipp-attribute-fidelity". The  
5635 Printer object MUST return this status code, even if there are Job Template attributes that are not supported  
5636 as well, since this error is a bigger problem than with Job Template attributes. See sections 3.1.7 and  
5637 3.2.1.1.

5638 13.1.4.19 client-error-document-access-error (0x0412) Issue 35

5639 The IPP object is refusing to service the Print-URI or Send-URI request because Printer encountered an  
5640 access error while attempting to validate the accessibility or access the document data specified in the  
5641 "document-uri" operation attribute. The Printer MAY also return a specific document access error code  
5642 using the "document-access-error" operation attribute (see section 3.1.6.4). This error is returned  
5643 independent of the client-supplied "ipp-attribute-fidelity". The Printer object MUST return this status code,  
5644 even if there are Job Template attributes that are not supported as well, since this error is a bigger problem  
5645 than with Job Template attributes. See section 3.1.7.

## 5646 13.1.5 Server Error Status Codes

5647 This class of status codes indicates cases in which the IPP object is aware that it has erred or is incapable of  
5648 performing the request. The IPP object SHOULD include a message containing an explanation of the error  
5649 situation, and whether it is a temporary or permanent condition.

## 5650 13.1.5.1 server-error-internal-error (0x0500)

5651 The IPP object encountered an unexpected condition that prevented it from fulfilling the request. This error  
5652 status code differs from "server-error-temporary-error" in that it implies a more permanent type of internal  
5653 error. It also differs from "server-error-device-error" in that it implies an unexpected condition (unlike a

5654 paper-jam or out-of-toner problem which is undesirable but expected). This error status code indicates that  
5655 probably some knowledgeable human intervention is required.

#### 5656 13.1.5.2 server-error-operation-not-supported (0x0501)

5657 The IPP object does not support the functionality required to fulfill the request. This is the appropriate  
5658 response when the IPP object does not recognize an operation or is not capable of supporting it. See section  
5659 3.1.7. Issue 18

#### 5660 13.1.5.3 server-error-service-unavailable (0x0502)

5661 The IPP object is currently unable to handle the request due to a temporary overloading or maintenance of  
5662 the IPP object. The implication is that this is a temporary condition which will be alleviated after some  
5663 delay. If known, the length of the delay may be indicated in the message. If no delay is given, the IPP  
5664 application should handle the response as it would for a "server-error-temporary-error" response. If the  
5665 condition is more permanent, the error status codes "client-error-gone" or "client-error-not-found" could be  
5666 used.

#### 5667 13.1.5.4 server-error-version-not-supported (0x0503)

5668 The IPP object does not support, or refuses to support, the IPP protocol version that was used in the request  
5669 message supplied as the value of the "version-number" operation parameter in the request. The IPP object  
5670 is indicating that it is unable or unwilling to complete the request using the same major and minor  
5671 number as supplied in the request other than with this error message. The error response should SHOULD  
5672 contain a Message "status-message" attribute (see section 3.1.6.2) describing why that version is not  
5673 supported and what other versions are supported by that IPP object. See section 3.1.8. Issue 11

5674 A conforming IPP/1.0 client MUST specify the valid version ('1.0') on each request. A conforming IPP/1.0  
5675 object MUST NOT return this status code to a conforming IPP/1.0 client. An IPP object MUST return this  
5676 status code to a non-conforming IPP client. The The error response MUST identify in the "version-number"  
5677 operation attribute parameter the closest version number that the IPP object does support. For example, if a  
5678 client supplies version '1.0' and an IPP/1.1 object supports version '1.0', then it MUST respond with version  
5679 '1.0' in all responses to such a request. If the IPP/1.1 object does not support version '1.0', then it SHOULD  
5680 accept the request and respond with version '1.1' or MAY reject the request and respond with this error code  
5681 and version '1.1'. If a client supplies a version '1.2' the IPP/1.1 object SHOULD accept the request and  
5682 return version '1.1' or MAY reject the request and respond with this error code and version '1.1'. See  
5683 sections 3.1.8 and 4.4.14. Issue 36

#### 5684 13.1.5.5 server-error-device-error (0x0504)

5685 A printer error, such as a paper jam, occurs while the IPP object processes a Print or Send operation. The  
5686 response contains the true Job Status (the values of the "job-state" and "job-state-reasons" attributes).  
5687 Additional information can be returned in the optional OPTIONAL "job-state-message" attribute value or in  
5688 the OPTIONAL status message that describes the error in more detail. This error status code is only  
5689 returned in situations where the Printer is unable to accept the create request because of such a device error.

5690 For example, if the Printer is unable to spool, and can only accept one job at a time, the reason it might  
5691 reject a create request is that the printer currently has a paper jam. In many cases however, where the  
5692 Printer object can accept the request even though the Printer has some error condition, the 'successful-ok'  
5693 status code will be returned. In such a case, the client would look at the returned Job Object Attributes or  
5694 later query the Printer to determine its state and state reasons.

#### 5695 13.1.5.6 server-error-temporary-error (0x0505)

5696 A temporary error such as a buffer full write error, a memory overflow (i.e. the document data exceeds the  
5697 memory of the Printer), or a disk full condition, occurs while the IPP Printer processes an operation. The  
5698 client MAY try the unmodified request again at some later point in time with an expectation that the  
5699 temporary internal error condition may have been cleared. Alternatively, as an implementation option, a  
5700 Printer object MAY delay the response until the temporary condition is cleared so that no error is returned.

#### 5701 13.1.5.7 server-error-not-accepting-jobs (0x0506)

5702 A temporary error indicating that the Printer is not currently accepting jobs, because the administrator has  
5703 set the value of the Printer's "printer-is-not-accepting-jobs" attribute to 'false' (by means outside of  
5704 [IPP/1.0](#):the scope of this IPP/1.1 document).

#### 5705 13.1.5.8 server-error-busy (0x0507)

5706 A temporary error indicating that the Printer is too busy processing jobs and/or other requests. The client  
5707 SHOULD try the unmodified request again at some later point in time with an expectation that the  
5708 temporary busy condition will have been cleared.

#### 5709 13.1.5.9 server-error-job-canceled (0x0508)

5710 An error indicating that the job has been canceled by an operator or the system while the client was  
5711 transmitting the data to the IPP Printer. If a job-id and job-uri had been created, then they are returned in  
5712 the Print-Job, Send-Document, or Send-URI response as usual; otherwise, no job-id and job-uri are returned  
5713 in the response.

#### 5714 [13.1.5.10 server-error-multiple-document-jobs-not-supported \(0x0509\)](#) Issue 34

5715 The IPP object does not support multiple documents per job and a client attempted to supply document data  
5716 with a second Send-Document or Send-URI operation.

## 5717 13.2 Status Codes for IPP Operations

5718 PJ = Print-Job, PU = Print-URI, CJ = Create-Job, SD = Send-Document  
 5719 SU = Send-URI, V = Validate-Job, GA = Get-Job-Attributes and  
 5720 Get-Printer-Attributes, GJ = Get-Jobs, C = Cancel-Job

5721		IPP Operations									
5722	IPP Status Keyword	PJ	PU	CJ	SD	SU	V	GA	GJ	C	
5723	-----	--	--	--	--	--	-	--	--	-	
5724	successful-ok	x	x	x	x	x	x	x	x	x	
5725	successful-ok-ignored-or-substituted-	x	x	x	x	x	x	x	x	x	
5726	attributes										
5727	successful-ok-conflicting-attributes	x	x	x	x	x	x	x	x	x	
5728	client-error-bad-request	x	x	x	x	x	x	x	x	x	
5729	client-error-forbidden	x	x	x	x	x	x	x	x	x	
5730	client-error-not-authenticated	x	x	x	x	x	x	x	x	x	
5731	client-error-not-authorized	x	x	x	x	x	x	x	x	x	
5732	client-error-not-possible	x	x	x	x	x	x	x	x	x	
5733	client-error-timeout				x	x					
5734	client-error-not-found	x	x	x	x	x	x	x	x	x	
5735	client-error-gone	x	x	x	x	x	x	x	x	x

## 5805 14. APPENDIX C: "media" keyword values

5806 Standard keyword values are taken from several sources.

5807 Standard values are defined (taken from DPA[ISO10175] and the Printer MIB[RFC1759]):

- 5808 'default': The default medium for the output device
- 5809 'iso-a4-white': Specifies the ISO A4 white medium
- 5810 'iso-a4-colored': Specifies the ISO A4 colored medium
- 5811 'iso-a4-transparent': Specifies the ISO A4 transparent medium
- 5812 'iso-a3-white': Specifies the ISO A3 white medium
- 5813 'iso-a3-colored': Specifies the ISO A3 colored medium
- 5814 'iso-a5-white': Specifies the ISO A5 white medium
- 5815 'iso-a5-colored': Specifies the ISO A5 colored medium
- 5816 'iso-b4-white': Specifies the ISO B4 white medium
- 5817 'iso-b4-colored': Specifies the ISO B4 colored medium
- 5818 'iso-b5-white': Specifies the ISO B5 white medium
- 5819 'iso-b5-colored': Specifies the ISO B5 colored medium
- 5820 'jis-b4-white': Specifies the JIS B4 white medium
- 5821 'jis-b4-colored': Specifies the JIS B4 colored medium
- 5822 'jis-b5-white': Specifies the JIS B5 white medium
- 5823 'jis-b5-colored': Specifies the JIS B5 colored medium

5824

5825 The following standard values are defined for North American media:

- 5826 'na-letter-white': Specifies the North American letter white medium
- 5827 'na-letter-colored': Specifies the North American letter colored medium
- 5828 'na-letter-transparent': Specifies the North American letter transparent medium
- 5829 'na-legal-white': Specifies the North American legal white medium
- 5830 'na-legal-colored': Specifies the North American legal colored medium

5831

5832 The following standard values are defined for envelopes:

- 5833 'iso-b4-envelope': Specifies the ISO B4 envelope medium
- 5834 'iso-b5-envelope': Specifies the ISO B5 envelope medium
- 5835 'iso-c3-envelope': Specifies the ISO C3 envelope medium
- 5836 'iso-c4-envelope': Specifies the ISO C4 envelope medium
- 5837 'iso-c5-envelope': Specifies the ISO C5 envelope medium
- 5838 'iso-c6-envelope': Specifies the ISO C6 envelope medium
- 5839 'iso-designated-long-envelope': Specifies the ISO Designated Long envelope medium
- 5840 'na-10x13-envelope': Specifies the North American 10x13 envelope medium
- 5841 'na-9x12-envelope': Specifies the North American 9x12 envelope medium

5842 'monarch-envelope': Specifies the Monarch envelope  
5843 'na-number-10-envelope': Specifies the North American number 10 business envelope medium  
5844 'na-7x9-envelope': Specifies the North American 7x9 inch envelope  
5845 'na-9x11-envelope': Specifies the North American 9x11 inch envelope  
5846 'na-10x14-envelope': Specifies the North American 10x14 inch envelope  
5847 'na-number-9-envelope': Specifies the North American number 9 business envelope  
5848 'na-6x9-envelope': Specifies the North American 6x9 inch envelope  
5849 'na-10x15-envelope': Specifies the North American 10x15 inch envelope  
5850

5851 The following standard values are defined for the less commonly used media (white-only):

5852 'executive-white': Specifies the white executive medium  
5853 'folio-white': Specifies the folio white medium  
5854 'invoice-white': Specifies the white invoice medium  
5855 'ledger-white': Specifies the white ledger medium  
5856 'quarto-white': Specified the white quarto medium  
5857 'iso-a0-white': Specifies the ISO A0 white medium  
5858 'iso-a1-white': Specifies the ISO A1 white medium  
5859 'iso-a2-white': Specifies the ISO A2 white medium  
5860 'iso-a6-white': Specifies the ISO A6 white medium  
5861 'iso-a7-white': Specifies the ISO A7 white medium  
5862 'iso-a8-white': Specifies the ISO A8 white medium  
5863 'iso-a9-white': Specifies the ISO A9 white medium  
5864 'iso-10-white': Specifies the ISO A10 white medium  
5865 'iso-b0-white': Specifies the ISO B0 white medium  
5866 'iso-b1-white': Specifies the ISO B1 white medium  
5867 'iso-b2-white': Specifies the ISO B2 white medium  
5868 'iso-b3-white': Specifies the ISO B3 white medium  
5869 'iso-b6-white': Specifies the ISO B6 white medium  
5870 'iso-b7-white': Specifies the ISO B7 white medium  
5871 'iso-b8-white': Specifies the ISO B8 white medium  
5872 'iso-b9-white': Specifies the ISO B9 white medium  
5873 'iso-b10-white': Specifies the ISO B10 white medium  
5874 'jis-b0-white': Specifies the JIS B0 white medium  
5875 'jis-b1-white': Specifies the JIS B1 white medium  
5876 'jis-b2-white': Specifies the JIS B2 white medium  
5877 'jis-b3-white': Specifies the JIS B3 white medium  
5878 'jis-b6-white': Specifies the JIS B6 white medium  
5879 'jis-b7-white': Specifies the JIS B7 white medium  
5880 'jis-b8-white': Specifies the JIS B8 white medium  
5881 'jis-b9-white': Specifies the JIS B9 white medium  
5882 'jis-b10-white': Specifies the JIS B10 white medium  
5883

5884 The following standard values are defined for engineering media (white only):

5885     `a-white`: Specifies the engineering A size medium  
5886     `b-white`: Specifies the engineering B size medium  
5887     `c-white`: Specifies the engineering C size medium  
5888     `d-white`: Specifies the engineering D size medium  
5889     `e-white`: Specifies the engineering E size medium  
5890

5891     The following standard values are defined for input-trays (from ISO DPA and the Printer MIB):

5892     `top`: The top input tray in the printer.  
5893     `middle`: The middle input tray in the printer.  
5894     `bottom`: The bottom input tray in the printer.  
5895     `envelope`: The envelope input tray in the printer.  
5896     `manual`: The manual feed input tray in the printer.  
5897     `large-capacity`: The large capacity input tray in the printer.  
5898     `main`: The main input tray  
5899     `side`: The side input tray  
5900

5901     The following standard values are defined for media sizes (from ISO DPA):

5902     `iso-a0`: Specifies the ISO A0 size: 841 mm by 1189 mm as defined in ISO 216  
5903     `iso-a1`: Specifies the ISO A1 size: 594 mm by 841 mm as defined in ISO 216  
5904     `iso-a2`: Specifies the ISO A2 size: 420 mm by 594 mm as defined in ISO 216  
5905     `iso-a3`: Specifies the ISO A3 size: 297 mm by 420 mm as defined in ISO 216  
5906     `iso-a4`: Specifies the ISO A4 size: 210 mm by 297 mm as defined in ISO 216  
5907     `iso-a5`: Specifies the ISO A5 size: 148 mm by 210 mm as defined in ISO 216  
5908     `iso-a6`: Specifies the ISO A6 size: 105 mm by 148 mm as defined in ISO 216  
5909     `iso-a7`: Specifies the ISO A7 size: 74 mm by 105 mm as defined in ISO 216  
5910     `iso-a8`: Specifies the ISO A8 size: 52 mm by 74 mm as defined in ISO 216  
5911     `iso-a9`: Specifies the ISO A9 size: 37 mm by 52 mm as defined in ISO 216  
5912     `iso-a10`: Specifies the ISO A10 size: 26 mm by 37 mm as defined in ISO 216  
5913     `iso-b0`: Specifies the ISO B0 size: 1000 mm by 1414 mm as defined in ISO 216  
5914     `iso-b1`: Specifies the ISO B1 size: 707 mm by 1000 mm as defined in ISO 216  
5915     `iso-b2`: Specifies the ISO B2 size: 500 mm by 707 mm as defined in ISO 216  
5916     `iso-b3`: Specifies the ISO B3 size: 353 mm by 500 mm as defined in ISO 216  
5917     `iso-b4`: Specifies the ISO B4 size: 250 mm by 353 mm as defined in ISO 216  
5918     `iso-b5`: Specifies the ISO B5 size: 176 mm by 250 mm as defined in ISO 216  
5919     `iso-b6`: Specifies the ISO B6 size: 125 mm by 176 mm as defined in ISO 216  
5920     `iso-b7`: Specifies the ISO B7 size: 88 mm by 125 mm as defined in ISO 216  
5921     `iso-b8`: Specifies the ISO B8 size: 62 mm by 88 mm as defined in ISO 216  
5922     `iso-b9`: Specifies the ISO B9 size: 44 mm by 62 mm as defined in ISO 216  
5923     `iso-b10`: Specifies the ISO B10 size: 31 mm by 44 mm as defined in ISO 216  
5924     `na-letter`: Specifies the North American letter size: 8.5 inches by 11 inches  
5925     `na-legal`: Specifies the North American legal size: 8.5 inches by 14 inches  
5926     `executive`: Specifies the executive size (7.25 X 10.5 in)  
5927     `folio`: Specifies the folio size (8.5 X 13 in)

5928 'invoice': Specifies the invoice size (5.5 X 8.5 in)  
5929 'ledger': Specifies the ledger size (11 X 17 in)  
5930 'quarto': Specifies the quarto size (8.5 X 10.83 in)  
5931 'iso-c3': Specifies the ISO C3 size: 324 mm by 458 mm as defined in ISO 269  
5932 'iso-c4': Specifies the ISO C4 size: 229 mm by 324 mm as defined in ISO 269  
5933 'iso-c5': Specifies the ISO C5 size: 162 mm by 229 mm as defined in ISO 269  
5934 'iso-c6': Specifies the ISO C6 size: 114 mm by 162 mm as defined in ISO 269  
5935 'iso-designated-long': Specifies the ISO Designated Long size: 110 mm by 220 mm as defined in ISO  
5936 269  
5937 'na-10x13-envelope': Specifies the North American 10x13 size: 10 inches by 13 inches  
5938 'na-9x12-envelope': Specifies the North American 9x12 size: 9 inches by 12 inches  
5939 'na-number-10-envelope': Specifies the North American number 10 business envelope size: 4.125  
5940 inches by 9.5 inches  
5941 'na-7x9-envelope': Specifies the North American 7x9 inch envelope size  
5942 'na-9x11-envelope': Specifies the North American 9x11 inch envelope size  
5943 'na-10x14-envelope': Specifies the North American 10x14 inch envelope size  
5944 'na-number-9-envelope': Specifies the North American number 9 business envelope size  
5945 'na-6x9-envelope': Specifies the North American 6x9 envelope size  
5946 'na-10x15-envelope': Specifies the North American 10x15 envelope size  
5947 'monarch-envelope': Specifies the Monarch envelope size (3.87 x 7.5 in)  
5948 'jis-b0': Specifies the JIS B0 size: 1030mm x 1456mm  
5949 'jis-b1': Specifies the JIS B1 size: 728mm x 1030mm  
5950 'jis-b2': Specifies the JIS B2 size: 515mm x 728mm  
5951 'jis-b3': Specifies the JIS B3 size: 364mm x 515mm  
5952 'jis-b4': Specifies the JIS B4 size: 257mm x 364mm  
5953 'jis-b5': Specifies the JIS B5 size: 182mm x 257mm  
5954 'jis-b6': Specifies the JIS B6 size: 128mm x 182mm  
5955 'jis-b7': Specifies the JIS B7 size: 91mm x 128mm  
5956 'jis-b8': Specifies the JIS B8 size: 64mm x 91mm  
5957 'jis-b9': Specifies the JIS B9 size: 45mm x 64mm  
5958 'jis-b10': Specifies the JIS B10 size: 32mm x 45mm

5959 The following standard values are defined for engineering media sizes:

5960 'a': Specifies the engineering A size: 8.5 inches x 11 inches  
5961 'b': Specifies the engineering B size: 11 inches x 17 inches  
5962 'c': Specifies the engineering C size: 17 inches x 22 inches  
5963 'd': Specifies the engineering D size: 22 inches x 34 inches  
5964 'e': Specifies the engineering E size: 34 inches x 44 inches  
5965

## 5966 15. APPENDIX D: Processing IPP Attributes

5967 When submitting a print job to a Printer object, the IPP model allows a client to supply operation and Job  
5968 Template attributes along with the document data. These Job Template attributes in the create request

5969 affect the rendering, production and finishing of the documents in the job. Similar types of instructions  
5970 may also be contained in the document to be printed, that is, embedded within the print data itself. In  
5971 addition, the Printer has a set of attributes that describe what rendering and finishing options which are  
5972 supported by that Printer. This model, which allows for flexibility and power, also introduces the potential  
5973 that at job submission time, these client-supplied attributes may conflict with either:

- 5974 - what the implementation is capable of realizing (i.e., what the Printer supports), as well as
- 5975 - the instructions embedded within the print data itself.

5976

5977 The following sections describe how these two types of conflicts are handled in the IPP model.

## 5978 15.1 Fidelity

5979 If there is a conflict between what the client requests and what a Printer object supports, the client may  
5980 request one of two possible conflict handling mechanisms:

- 5981 1) either reject the job since the job can not be processed exactly as specified, or
- 5982 2) allow the Printer to make any changes necessary to proceed with processing the Job the best it can.

5983

5984 In the first case the client is indicating to the Printer object: "Print the job exactly as specified with no  
5985 exceptions, and if that can't be done, don't even bother printing the job at all." In the second case, the client  
5986 is indicating to the Printer object: "It is more important to make sure the job is printed rather than be  
5987 processed exactly as specified; just make sure the job is printed even if client supplied attributes need to be  
5988 changed or ignored."

5989 The IPP model accounts for this situation by introducing an "ipp-attribute-fidelity" attribute.

5990 In a create request, "ipp-attribute-fidelity" is a boolean operation attribute that is **OPTIONALLY** supplied  
5991 by the client. The value 'true' indicates that total fidelity to client supplied Job Template attributes and  
5992 values is required. The client is requesting that the Job be printed exactly as specified, and if that is not  
5993 possible then the job **MUST** be rejected rather than processed incorrectly. The value 'false' indicates that a  
5994 reasonable attempt to print the Job is acceptable. If a Printer does not support some of the client supplied  
5995 Job Template attributes or values, the Printer **MUST** ignore them or substitute any supported value for  
5996 unsupported values, respectively. The Printer may choose to substitute the default value associated with  
5997 that attribute, or use some other supported value that is similar to the unsupported requested value. For  
5998 example, if a client supplies a "media" value of 'na-letter', the Printer may choose to substitute 'iso-a4' rather  
5999 than a default value of 'envelope'. If the client does not supply the "ipp-attribute-fidelity" attribute, the  
6000 Printer assumes a value of 'false'.

6001 Each Printer implementation **MUST** support both types of "fidelity" printing (that is whether the client  
6002 supplies a value of 'true' or 'false');

- 6003 - If the client supplies 'false' or does not supply the attribute, the Printer object **MUST** always accept the  
6004 request by ignoring unsupported Job Template attributes and by substituting unsupported values of  
6005 supported Job Template attributes with supported values.

6006 - If the client supplies 'true', the Printer object MUST reject the request if the client supplies  
6007 unsupported Job Template attributes.  
6008

6009 Since a client can always query a Printer to find out exactly what is and is not supported, "ipp-attribute-  
6010 fidelity" set to 'false' is useful when:

- 6011 1) The End-User uses a command line interface to request attributes that might not be supported.
- 6012 2) In a GUI context, if the End User expects the job might be moved to another printer and prefers a  
6013 sub-optimal result to nothing at all.
- 6014 3) The End User just wants something reasonable in lieu of nothing at all.  
6015

## 6016 15.2 Page Description Language (PDL) Override

6017 If there is a conflict between the value of an IPP Job Template attribute and a corresponding instruction in  
6018 the document data, the value of the IPP attribute SHOULD take precedence over the document instruction.  
6019 Consider the case where a previously formatted file of document data is sent to an IPP Printer. In this case,  
6020 if the client supplies any attributes at job submission time, the client desires that those attributes override  
6021 the embedded instructions. Consider the case where a previously formatted document has embedded in it  
6022 commands to load 'iso-a4' media. However, the document is passed to an end user that only has access to a  
6023 printer with 'na-letter' media loaded. That end user most likely wants to submit that document to an IPP  
6024 Printer with the "media" Job Template attribute set to 'na-letter'. The job submission attribute should take  
6025 precedence over the embedded PDL instruction. However, until companies that supply document data  
6026 interpreters allow a way for external IPP attributes to take precedence over embedded job production  
6027 instructions, a Printer might not be able to support the semantics that IPP attributes override the embedded  
6028 instructions.

6029 The IPP model accounts for this situation by introducing a "pdl-override-supported" attribute that describes  
6030 the Printer objects capabilities to override instructions embedded in the PDL data stream. The value of the  
6031 "pdl-override-supported" attribute is configured by means outside [IPP/1.0:the scope of this IPP/1.1](#)  
6032 [document](#).

6033 This REQUIRED Printer attribute takes on the following values:

- 6034 - 'attempted': This value indicates that the Printer object attempts to make the IPP attribute values take  
6035 precedence over embedded instructions in the document data, however there is no guarantee.
- 6036 - 'not-attempted': This value indicates that the Printer object makes no attempt to make the IPP attribute  
6037 values take precedence over embedded instructions in the document data.  
6038

6039 At job processing time, an implementation that supports the value of 'attempted' might do one of several  
6040 different actions:

- 6041 1) Generate an output device specific command sequence to realize the feature represented by the IPP  
6042 attribute value.
- 6043 2) Parse the document data itself and replace the conflicting embedded instruction with a new  
6044 embedded instruction that matches the intent of the IPP attribute value.

- 6045 3) Indicate to the Printer that external supplied attributes take precedence over embedded instructions  
6046 and then pass the external IPP attribute values to the document data interpreter.  
6047 4) Anything else that allows for the semantics that IPP attributes override embedded document data  
6048 instructions.  
6049

6050 Since 'attempted' does not offer any type of guarantee, even though a given Printer object might not do a  
6051 very "good" job of attempting to ensure that IPP attributes take a higher precedence over instructions  
6052 embedded in the document data, it would still be a conforming implementation.

6053 At job processing time, an implementation that supports the value of 'not-attempted' might do one of the  
6054 following actions:

- 6055 1) Simply pre-pend the document data with the PDL instruction that corresponds to the client-supplied  
6056 PDL attribute, such that if the document data also has the same PDL instruction, it will override  
6057 what the Printer object pre-pended. In other words, this implementation is using the same  
6058 implementation semantics for the client-supplied IPP attributes as for the Printer object defaults.  
6059 2) Parse the document data and replace the conflicting embedded instruction with a new embedded  
6060 instruction that approximates, but does not match, the semantic intent of the IPP attribute value.  
6061

6062 Note: The "ipp-attribute-fidelity" attribute applies to the Printer's ability to either accept or reject other  
6063 unsupported Job Template attributes. In other words, if "ipp-attribute-fidelity" is set to 'true', a Job is  
6064 accepted if and only if the client supplied Job Template attributes and values are supported by the Printer.  
6065 Whether these attributes actually affect the processing of the Job when the document data contains  
6066 embedded instructions depends on the ability of the Printer to override the instructions embedded in the  
6067 document data with the semantics of the IPP attributes. If the document data attributes can be overridden  
6068 ("pdl-override-supported" set to 'attempted'), the Printer makes an attempt to use the IPP attributes when  
6069 processing the Job. If the document data attributes can not be overridden ("pdl-override-supported" set to  
6070 'not-attempted'), the Printer makes no attempt to override the embedded document data instructions with the  
6071 IPP attributes when processing the Job, and hence, the IPP attributes may fail to affect the Job processing  
6072 and output when the corresponding instruction is embedded in the document data.

### 6073 15.3 Using Job Template Attributes During Document Processing.

6074 The Printer object uses some of the Job object's Job Template attributes during the processing of the  
6075 document data associated with that job. These include, but are not limited to, "orientation-requested",  
6076 "number-up", "sides", "media", and "copies". The processing of each document in a Job Object MUST  
6077 follow the steps below. These steps are intended only to identify when and how attributes are to be used in  
6078 processing document data and any alternative steps that accomplishes the same effect can be used to  
6079 implement this specification [document](#).

- 6080 1. Using the client supplied "document-format" attribute or some form of document format detection  
6081 algorithm (if the value of "document-format" is not specific enough), determine whether or not the  
6082 document data has already been formatted for printing. If the document data has been formatted,  
6083 then go to step 2. Otherwise, the document data MUST be formatted. The formatting detection  
6084 algorithm is implementation defined and is not specified by this [specification document](#). The

- 6085 formatting of the document data uses the "orientation-requested" attribute to determine how the  
6086 formatted print data should be placed on a print-stream page, see section 4.2.10 for the details.  
6087
- 6088 2. The document data is in the form of a print-stream in a known media type. The "page-ranges"  
6089 attribute is used to select, as specified in section 4.2.7, a sub-sequence of the pages in the print-  
6090 stream that are to be processed and images.  
6091
- 6092 3. The input to this step is a sequence of print-stream pages. This step is controlled by the "number-up"  
6093 attribute. If the value of "number-up" is N, then during the processing of the print-stream pages,  
6094 each N print-stream pages are positioned, as specified in section 4.2.9, to create a single impression.  
6095 If a given document does not have N more print-stream pages, then the completion of the  
6096 impression is controlled by the "multiple-document-handling" attribute as described in section 4.2.4;  
6097 when the value of this attribute is 'single-document' or 'single-document-new-sheet', the print-stream  
6098 pages of document data from subsequent documents is used to complete the impression.  
6099
- 6100 The size(scaling), position(translation) and rotation of the print-stream pages on the impression is  
6101 implementation defined. Note that during this process the print-stream pages may be rendered to a  
6102 form suitable for placing on the impression; this rendering is controlled by the values of the "printer-  
6103 resolution" and "print-quality" attributes as described in sections 4.2.12 and 4.2.13. In the case N=1,  
6104 the impression is nearly the same as the print-stream page; the differences would only be in the size,  
6105 position and rotation of the print-stream page and/or any decoration, such as a frame to the page,  
6106 that is added by the implementation.  
6107
- 6108 4. The collection of impressions is placed, in sequence, onto sides of the media sheets. This placement  
6109 is controlled by the "sides" attribute and the orientation of the print-stream page, as described in  
6110 section 4.2.8. The orientation of the print-stream pages affects the orientation of the impression; for  
6111 example, if "number-up" equals 2, then, typically, two portrait print-stream pages become one  
6112 landscape impression. Note that the placement of impressions onto media sheets is also controlled  
6113 by the "multiple-document-handling" attribute as described in section 4.2.4.  
6114
- 6115 5. The "copies" and "multiple-document-handling" attributes are used to determine how many copies of  
6116 each media instance are created and in what order. See sections 4.2.5 and 4.2.4 for the details.  
6117
- 6118 6. When the correct number of copies are created, the media instances are finished according to the  
6119 values of the "finishings" attribute as described in 4.2.6. Note that sometimes finishing operations  
6120 may require manual intervention to perform the finishing operations on the copies, especially  
6121 uncollated copies. This [specification document](#) allows any or all of the processing steps to be  
6122 performed automatically or manually at the discretion of the Printer object.

## 6123 16. APPENDIX E: Generic Directory Schema

6124 This section defines a generic schema for an entry in a directory service. A directory service is a means by  
6125 which service users can locate service providers. In IPP environments, this means that IPP Printers can be  
6126 registered (either automatically or with the help of an administrator) as entries of type printer in the

6127 directory using an implementation specific mechanism such as entry attributes, entry type fields, specific  
 6128 branches, etc. IPP clients can search or browse for entries of type printer. Clients use the directory service  
 6129 to find entries based on naming, organizational contexts, or filtered searches on attribute values of entries.  
 6130 For example, a client can find all printers in the "Local Department" context. Authentication and  
 6131 authorization are also often part of a directory service so that an administrator can place limits on end users  
 6132 so that they are only allowed to find entries to which they have certain access rights. IPP itself does not  
 6133 require any specific directory service protocol or provider.

6134 Note: Some directory implementations allow for the notion of "aliasing". That is, one directory entry object  
 6135 can appear as multiple directory entry object with different names for each object. In each case, each alias  
 6136 refers to the same directory entry object which refers to a single IPP Printer object.

6137 The generic schema is a subset of IPP Printer Job Template and Printer Description attributes (sections 4.2  
 6138 and 4.4). These attributes are identified as either RECOMMENDED or OPTIONAL for the directory entry  
 6139 itself. This conformance labeling is NOT the same conformance labeling applied to the attributes of IPP  
 6140 Printers objects. The conformance labeling in this Appendix is intended to apply to directory templates and  
 6141 to IPP Printer implementations that subscribe by adding one or more entries to a directory.  
 6142 RECOMMENDED attributes SHOULD be associated with each directory entry. OPTIONAL attributes  
 6143 MAY be associated with the directory entry (if known or supported). In addition, all directory entry  
 6144 attributes SHOULD reflect the current attribute values for the corresponding Printer object.

6145 The names of attributes in directory schema and entries SHOULD be the same as the IPP Printer attribute  
 6146 names as shown.

6147 In order to bridge between the directory service and the IPP Printer object, one of the RECOMMENDED  
 6148 directory entry attributes is the Printer object's "printer-uri-supported" attribute. The IPP client queries the  
 6149 "printer-uri-supported" attribute in the directory entry and then addresses the IPP Printer object using one of  
 6150 its URIs. The "uri-security-supported" attribute identifies the protocol (if any) used to secure a channel.

6151 The following attributes define the generic schema for directory entries of type PRINTER:

6152	printer-uri-supported	RECOMMENDED	Section 4.4.1
6153	<u>uri-authentication-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.2</u>
6154	uri-security-supported	RECOMMENDED	Section 4.4.3
6155	printer-name	RECOMMENDED	Section 4.4.4
6156	printer-location	RECOMMENDED	Section 4.4.5
6157	printer-info	OPTIONAL	Section 4.4.6
6158	printer-more-info	OPTIONAL	Section 4.4.7
6159	printer-make-and-model	RECOMMENDED	Section 4.4.9
6160	<u>ipp-versions-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.14</u>
6161	<u>multiple-document-jobs-supported</u>	<u>OPTIONAL</u>	<u>Section 4.4.16</u>
6162	charset-supported	OPTIONAL	Section 4.4.18
6163	generated-natural-language-		
6164	supported	OPTIONAL	Section 4.4.20
6165	document-format-supported	RECOMMENDED	Section 4.4.22
6166	color-supported	RECOMMENDED	Section 4.4.26
6167	<u>compression-supported</u>	<u>RECOMMENDED</u>	<u>Section 4.4.32</u>

6168	<u>pages-per-minute</u>	<u>OPTIONAL</u>	<u>Section 4.4.36</u>
6169	<u>pages-per-minute-color</u>	<u>OPTIONAL</u>	<u>Section 4.4.37</u>
6170			
6171	finishings-supported	OPTIONAL	Section 4.2.6
6172	number-up-supported	OPTIONAL	Section 4.2.7
6173	sides-supported	RECOMMENDED	Section 4.2.8
6174	media-supported	RECOMMENDED	Section 4.2.11
6175	printer-resolution-supported	OPTIONAL	Section 4.2.12
6176	print-quality-supported	OPTIONAL	Section 4.2.13
6177			

6178 ~~APPENDIX F: Change History for the IPP Model and Semantics document~~

6179 ~~The following substantive changes and major clarifications have been made to this document from the June~~  
6180 ~~30, 1998 version based on the interoperability testing that took place September 23-25 1998 and subsequent~~  
6181 ~~mailing list and meeting discussions. They are listed in the order of occurrence in the document. These~~  
6182 ~~changes are the ones that might affect implementations. Clarifications that are unlikely to affect~~  
6183 ~~implementations are not listed. The issue numbers refer to the IPP Issues List which is available in the~~  
6184 ~~following directory:~~

6185  
6186 ~~<ftp://ftp.pwg.org/pub/pwg/ipp/approved-clarifications/>~~

6187  
6188

Section	Description
global	<del>Replaced TLS references with SSL3 references as agreed with our Area Director on 11/12/1998.</del>
global	<del>Removed the indications that some of these IPP documents are informational, since the intent is now to publish all IPP/1.0 documents as informational as agreed with our Area Director on 11/12/1998.</del>
<del>3.1.2, 16.3.3 {now IPP- HG}</del>	<del>Clarify that the IPP object SHOULD NOT validate the range of the request-id being 1 to 2**31-1, but accepts and returns any value. Clients MUST still keep in the range 1 to 2**31 though. If the request is terminated before the complete "request-id" is received, the IPP object rejects the request and returns a response with a "request-id" of 0 (Issue 1.36).</del>
<del>3.1.4.1, 14.1.4.14</del>	<del>Clarified that when a client submits a request in a charset that is not supported, the IPP object SHOULD return any 'text' or 'name' attributes in the 'utf-8' charset, if it returns any, since clients and IPP objects MUST support 'utf-8'. (Issue 1.19)</del>
<del>3.1.4.1</del>	<del>Clarified Section 3.1.4.1 Request Operation Attributes that a client MAY use the attribute level natural language override (text/nameWithLanguage) redundantly in a request. (Issue 1.46)</del>
<del>3.1.4.2</del>	<del>Clarified Section 3.1.4.2 Response Operation Attributes that an IPP object MAY use the attribute level natural language override</del>

	<del>(text/nameWithLanguage) redundantly in a response. (Issue 1.46)</del>
3.1.6	<del>Clarified section 3.1.6: If the Printer object supports the "status-message" operation attribute, it NEED NOT return a status message for the following error status codes: 'client-error-bad-request', 'client-error-charset-not-supported', 'server-error-internal-error', 'server-error-operation-not-supported', and 'server-error-version-not-supported'.</del>
3.2.1.1	<del>Clarified that if a client is not supplying any Job Template attributes in a request, the client SHOULD omit Group 2 rather than sending an empty group. However, a Printer object MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.16)</del>
3.2.1.2, 3.2.5.2, 3.2.6.2, 3.3.1.2, 3.3.3.2, 3.3.4.2,	<del>Clarified that if an IPP object is not returning any Unsupported Attributes in a response, the IPP object SHOULD omit Group 2 rather than sending an empty group. However, a client MUST be able to accept an empty group. This makes [IPP-MOD] agree with [IPP-PRO]. (Issue 1.17)</del>
3.2.1.2, 14.1.2.2, 14.1.4.12	<del>Clarified that an IPP object MUST treat an unsupported attribute syntax supplied in a request in the same way as an unsupported value. The IPP object MUST return the attribute, the attribute syntax, and the value in the Unsupported Attributes group. (Issue 1.26)</del>
3.2.5.2, 3.2.6.2, 3.3.4.2, 14.1.2.1, 14.1.2.2, 14.1.4.12	<del>Clarified for Get-Printer-Attributes, Get-Jobs, and Get-Job-Attributes that an IPP object MUST return 'successful-ok-ignored-or-substituted-attributes' (0x1), rather than 'successful-ok' (0x0), when a client supplies unsupported attributes as values of the 'requested-attributes' operation attribute. (Issue 1.24) Also clarified that the response NEED NOT contain the "requested-attributes" operation attribute with any supplied values (attribute keywords) that were requested by the client but are not supported by the IPP object. (Issue 1.18)</del>
3.2.6.2 4.1.1.2 4.3.24	<del>Deleted the job-level natural language override (NLO) from Section 3.2.6.2 Get-Jobs Response so that all operation responses are the same with respect to NLO. (Issue 1.47)</del>
3.3.1	<del>Clarified that an IPP Printer that supports the Create-Job operation MUST handle the situation when a client does not supply Send-Document or Send-URI operations within a one-to-four minute time period. Also clarified that a client MUST send documents in a multi-document job without undue or unbounded delay. (Issue 1.28)</del>
3.3.3	<del>Clarified that the IPP object MUST reject a Cancel-Job request if the job is in 'completed', 'canceled', or 'aborted' job states. (Issue 1.12)</del>
4.1.2.3	<del>Added this new sub-section: it specifies that nameWithoutLanguage plus the implicit natural language matches nameWithLanguage, if the values and natural languages are the same. Also added that keyword never matches nameWithLanguage or nameWithoutLanguage. Clarified that if both have countries, that the countries SHOULD match as well. If either do not, then the country field SHOULD be ignored. (Issues 1.33 and 1.34)</del>

4.1.5	<del>Clarified regarding the case insensitivity of URLs to refer only to the RFCs that define them. (Issue 1.10)</del>
4.1.11	<del>Clarified that 'boolean' is not a full-sized integer. (Issue 1.38)</del>
4.1.15	<del>Clarified that 'resolution' is not three full-sized integers. (Issue 1.20)</del>
4.2.*	<del>Clarified that standard values are keywords or enums, not names. (Issue 1.49).</del>
4.2.4	<del>Added the 'single-document-new-sheet' value to Section 4.2.4 multiple-document handling. (Issue 1.54)</del>
4.4.18, 4.4.19	<del>Clarified that the "document-format-default" and "document-format-supported" Printer Description attributes are REQUIRED to agree with the table. (Issue 1.4)</del>
4.4.21	<del>Changed "queued-job-count" from OPTIONAL to RECOMMENDED. (Issue 1.14)</del>
4.4.28	<del>Clarified that the implementation-supplied value for the "multiple-operation-time-out" attribute SHOULD be between 30 and 240 seconds, though the implementation MAY allow the administrator to set values, and MAY allow values outside this range. (Issue 1.28)</del>
5.1, 5.2.5	<del>Clarified Client Conformance that if a client supports an attribute of 'text' attribute syntax, that it MUST support both the textWithoutLanguage and the textWithLanguage forms. Same for 'name' attribute syntax. Same for an IPP object (Issue 1.48)</del>
6.5, 12.8	<del>Added new section to allow Attribute Groups to be registered as extensions for being passed in operation requests and responses. (Issue 1.25)</del>
7.	<del>Updated the table of text and name attributes to agree with Section 4.2.</del>
8.5	<del>Added a new section RECOMMENDING that the Get-Jobs SHOULD return non-IPP jobs whether or not assigning them a job-id and job-uri. Also RECOMMENDED generating, if possible, job-id and job-uri and supporting other IPP operations on foreign jobs as an implementer option. (Issue 1.32)</del>
9.	<del>Updated document references.</del>
14.1.4.14	<del>Clarified 'client-error-charset-not-supported' that 'utf-8' must be used for any 'text' or 'name' attributes returned in the error response (Issue 1.19).</del>
14.1.5.9	<del>Added a new error code 'server-error-job-canceled' (0x0508) to be returned if a job is canceled by another client or aborted by the IPP object while the first client is still sending the document data. (Issue 1.29)</del>
16.3, 16.4	<del>Moved these sections recommending operation processing steps to the new Implementer's Guide (informational). There indicated that all of the error checks are not required, so an IPP object MAY be forgiving and accept non-conforming requests. However, a conforming client MUST supply requests that would pass all of the error checks indicated. (Issue 1.21)</del>
17	<del>Changed directory schema attributes from REQUIRED to RECOMMENDED. Changed some of the OPTIONAL to RECOMMENDED to agree with the SLP template. Changed the "charset-supported" and "natural-language-supported" from REQUIRED to OPTIONAL. Recommended that the names be the same in a directory</del>

	<del>entry as the IPP attribute names. (Issue 1.53)</del>
--	---

6189

6190 17. APPENDIX F: Differences between the IPP/1.0 and IPP/1.1 "Model and Semantics" Documents

6191 This Appendix is divided into two lists that summarize the differences between IPP/1.1 (this document) and  
6192 IPP/1.0 [RFC2566]. The section numbers refer to the numbers in this document which in some cases have  
6193 changed from RFC 2566. When a change affects multiple sections, the item is listed once in the order of  
6194 the first section affected and the remaining affected section numbers are indicated.

6195 The first list contains extensions and clarifications and the second list contains changes in semantics or  
6196 conformance. However, client and IPP object implementations of IPP/1.0 MAY implement any of the  
6197 extensions and clarifications in this document.

6198 The following extensions and clarifications have been incorporated into this document:

- 6199 1. Section 2.1 - clarified that the term "client" can be either contained in software controlled by an end  
6200 user or a part of a print server that controls devices. Issue 4
- 6201 2. Section 2 - clarified that the term "IPP object" and "Printer object" can either be embedded in a  
6202 device object or part of a print server that accepts IPP requests. Issue 4
- 6203 3. Section 2.4 - added the description of the new "uri-authentication-supported" Printer Description  
6204 attribute. Issue 2
- 6205 4. Section 3.1.3, 3.1.6, 3.2.5.2, and 3.2.6.2 - clarified the error handling for operation attributes that  
6206 have their own status code. Issues 18, 23, and 27
- 6207 5. Section 3.1.6 - reorganized this section into sub-sections to separately describe "status-code",  
6208 "status-message", "detailed-status-message", and "document-access-error" attributes. Issue 18
- 6209 6. Section 3.1.6.1 - clarified the error status codes and their relationship to operation attributes. Issue  
6210 18
- 6211 7. Section 3.1.6.3 - Added the OPTIONAL "detailed-status-message (text(MAX))" operation attribute  
6212 to provide additional more detailed information about a response. Issue 35
- 6213 8. Section 3.1.6.4 and 3.2.2 - Added the OPTIONAL "document-access-error (text(MAX))" operation  
6214 attribute for use with Print-URI and Send-URI responses. Issue 35
- 6215 9. Sections 3.1.7 - Added this new section to clarify returning Unsupported Attributes for all  
6216 operations, including only returning attributes that were in the request. Moved the text from section  
6217 3.2.1.2 Unsupported Attributes to this section. Issues 18, 23, and 27
- 6218 10. Sections 3.1.7 and 4.1 - clarified the encoding of the "out-of-band" 'unsupported' and 'unknown'  
6219 values. Issues 12 and 15
- 6220 11. Section 3.1.8 - clarified that only the version number parameter will be carried forward into future  
6221 major or minor versions of the protocol.
- 6222 12. Section 3.1.8 - relaxed the requirements to increment the major version number in future versions of  
6223 the Model and Semantics document. Issue 33
- 6224 13. Section 3.1.9, and 3.2.5 - added the 'processing' state to the list of job states that a job can be in after  
6225 a Create-Job operation. Issue 13
- 6226 14. Section 3.1.9 - clarified that a non-spooling Printer MAY accept zero or more subsequent jobs while  
6227 processing a job and flow control them down. Subsequent create requests are rejected with the  
6228 'server-error-busy' error status. Issue 20

- 6229 15. Section 3.2.1.1 - clarified the validation of the "compression" operation attribute and its relationship  
6230 to the validation of the "document-format" attribute and returning Unsupported Attributes. **Issues 6,**  
6231 **Issue 11, and Issue 28**
- 6232 16. Sections 3.2.1.1, 4.3.8, 13.1.4.16, and 13.1.4.17 - added the 'client-error-compression-not-  
6233 supported', 'client-error-compression-error' status codes and the 'unsupported-compression' and  
6234 'compression-error' job-state-reasons. **Issue 28**
- 6235 17. Sections 3.2.1.1 and 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job-  
6236 state-reasons. **Issue 3**
- 6237 18. Sections 3.2.2, 4.3.8 and 13.1.4.19 - added 'client-error-document-access-error' status code and  
6238 'document-access-error' job state reason. **Issue 35**
- 6239 19. Section 3.2.5.2 and 3.2.6.2 - clarified that the Unsupported Attributes group MUST NOT include  
6240 attributes not requested in the Get-Printer-Attributes request. **Issue 23**
- 6241 20. Section 3.2.6 - clarified that "limit" takes precedence over "which-jobs" and "my-jobs'. **Issue 8**  
6242 21. Section 3.2.6.2 - clarified that Get-Jobs returns 'successful-ok' when no jobs to return. **Issue 24**
- 6243 22. Sections 3.2.7, 3.2.8, and 3.2.9 - added the OPTIONAL Pause-Printer, Resume-Printer, and Purge-  
6244 Jobs operations
- 6245 23. Section 3.3.1 - clarified that the authorization required for a Send-Document request MUST be the  
6246 same user as the Create-Job or an operator. **Issue 19**
- 6247 24. Sections 3.3.5, 3.3.6, and 3.3.7 - added the OPTIONAL Hold-Job, Release-Job, and Restart-Job  
6248 operations.
- 6249 25. Section 4.1 - clarified that the encoding of the out-of-band values are specified in the Encoding and  
6250 Transport" document. **Issue 12 and Issue 15**
- 6251 26. Section 4.1.9.1 - clarified that 'application/octet-stream' auto-sensing can happen at create request  
6252 time and/or job/document processing time. **Issue 9 and Issue 10**
- 6253 27. Section 4.1.14 - clarified that the localization of dateTime by the client includes the time zone.  
6254 **Issue 17**
- 6255 28. Section 4.2 - clarified that xxx-supported have multiple keywords and/or names by adding  
6256 parentheses to the table to give: (1setOf (type3 keyword | name))
- 6257 29. Section 4.2.2 - added the 'indefinite' keyword value to the "job-hold-until" attribute for use with the  
6258 create operations and Hold-Job and Restart-Job operations.
- 6259 30. Section 4.2.6 - added more enum values to the "finishings" Job Template attribute.
- 6260 31. Section 4.3.7 - added that a forwarding server that cannot get any job state MAY return the job's  
6261 state as 'completed', provided that it also return the new 'queued-in-device' job state reason. **Issue 14**
- 6262 32. Section 4.3.7.2 - added the Partitioning of Job States section to clarify the concepts of Job  
6263 Retention, Job History, and Job Removal.
- 6264 33. Section 4.3.8 - added 'job-data-insufficient' job state reason to indicate whether sufficient data has  
6265 arrived for the document to start to be processed. **Issue 13**
- 6266 34. Section 4.3.8 - added 'document-access-error' job state reason to indicate an access error of any kind.  
6267 **Issue 35**
- 6268 35. Section 4.3.8 - added 'job-queued-for-marker' job state reason to indicate whether the job has  
6269 completed some processing and is waiting for the marker. **Issue 31**
- 6270 36. Section 4.3.8 - added 'unsupported-compression' and 'compression-error' job state reasons to  
6271 indicate compression not supported or compression processing error after the create has been  
6272 accepted. **Issue 6**

- 6273 37. Section 4.3.8 - added 'unsupported-document-format' and 'document-format-error' job state reasons  
6274 to indicate document not supported or document format processing error after the create has been  
6275 accepted. Issue 3
- 6276 38. Section 4.3.8 - added 'queued-in-device' job state reason to indicate that a job as been forwarded to a  
6277 print system or device that does not provide any job status. Issue 14
- 6278 39. Section 4.3.10 - added "job-detailed-status-messages (1setOf text(MAX)) for returning detailed  
6279 error messages. Issue 35
- 6280 40. Section 4.3.11 - added the "job-document-access-errors (1setOf text(MAX)) Issue 35
- 6281 41. Section 4.3.14.2 - clarified that the time recorded is the first time processing since the create  
6282 operation or the Restart-Job operation. Issue 17
- 6283 42. Section 4.3.14.2 and 4.3.14.3 - clarified that the out-of-band value 'no-value' is returned if the job  
6284 has not started processing or has not completed, respectively. Issue 17
- 6285 43. Section 4.3.14 - Added the OPTIONAL "date-time-at-creation", "date-time-at-processing", and  
6286 "date-time-at-completed" Event Time Job Description attributes Issue 17
- 6287 44. Section 4.4.3 - added the 'tls' value to "uri-security-supported" attribute.
- 6288 45. Section 4.4.3 - clarified "uri-security-supported" is orthogonal to Client Authentication so that 'none'  
6289 does not exclude Client Authentication. Issue 2
- 6290 46. Section 4.4.11 - simplified the "printer-state" descriptions while generalizing to allow high end  
6291 devices that interpret one or more jobs while marking another. Indicated that 'spool-area-full' and  
6292 'stopped-partly' "printer-state-reasons" may be used to provide further state information. Issue 31
- 6293 47. Section 4.4.12 - added the 'moving-to-paused' keyword value to the "printer-state-reasons" attribute  
6294 for use with the Pause-Job operation.
- 6295 48. Section 4.4.12 - replaced the duplicate 'marker-supply-low' keyword with the missing 'toner-empty'  
6296 keyword for the "printer-state-reasons" attribute. (This correction was also made before RFC 2566  
6297 was published).
- 6298 49. Section 4.4.12 - clarified 'spool-area-full' "printer-state-reasons" to include non-spooling printers to  
6299 indicate when it can and cannot accept another job. Issue 20
- 6300 50. Section 4.4.15 - added the enum values to the "operations-supported" attribute for the new  
6301 operations. Clarified that the values of this attribute are encoded as any enum, namely 32-bit values.
- 6302 51. Section 4.4.30 - clarified that the dateTime value of "printer-current-time" is on a "best efforts  
6303 basis". If a proper date-time cannot be obtained, the implementation returns the 'no-value' out-of-  
6304 band value. Also clarified that the time zone NEED NOT be the time zone that the people near the  
6305 device use and that the client SHOULD display the dateTime attributes in the user's local time.  
6306 Issue 17
- 6307 52. Sections 4.4.36 and 4.4.37 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-  
6308 color" Printer Description attributes.
- 6309 53. Section 5.1 - clarified that the client conformance requirements apply to clients controlled by an end  
6310 user and clients in servers. Issue 4
- 6311 54. Section 5.1 - clarified that any response MAY contain additional attribute groups, attributes,  
6312 attribute syntaxes, or attribute values. Issue 25 and Issue 26
- 6313 55. Section 5.1 - clarified that a client SHOULD do its best to prevent a channel from being closed by a  
6314 lower layer when the channel is flow controlled off by the IPP Printer. Issue 4 and Issue 5
- 6315 56. Section 5.2 - clarified that the IPP object requirements apply to objects embedded in devices or that  
6316 are parts of servers. Issue 4

- 6317 57. Section 5.2.2 - clarified that IPP objects MAY return operation responses that contain attribute  
6318 groups, attribute names, attribute syntaxes, attribute values, and status codes that are extensions to  
6319 this standard. Issue 26
- 6320 58. Section 8.3 - clarified the use of URIs for each Client Authentication mechanism.
- 6321 59. Section 8.5 - added the security discussion around the new operator/administrator operations.
- 6322 60. Section 13.1.4.16 - added client-error-compression-not-supported (0x040F) Issue 6
- 6323 61. Section 13.1.4.17 - added client-error-compression-error (0x0410) Issue 6
- 6324 62. Section 13.1.4.18 - added client-error-document-format-error (0x0411) Issue 28
- 6325 63. Section 13.1.4.19 - added client-error-document-access-error (0x0412) Issue 35
- 6326 64. Section 13.1.5.10 - added server-error-multiple-document-jobs-not-supported (0x0509) Issue 34
- 6327 65. Section 14 - added 'a-white', 'b-white', 'c-white', 'd-white', and 'e-white' and clarified that the existing  
6328 'a', 'b', 'c', 'd', and 'e' values are size values.
- 6329 66. Section 16 - added the OPTIONAL "pages-per-minute" and "pages-per-minute-color" Printer  
6330 attributes to the Directory schema.
- 6331 67. Section 16 - added OPTIONAL "multiple-document-jobs-supported" to the Directory schema. Issue  
6332 34
- 6333 68. Section 16 - added RECOMMENDED "uri-authentication-supported", "ipp-versions-supported",  
6334 and "compression-supported" to the Directory schema. Issue 2, Issue 36, and Issue 28

6335 The following changes in semantics and/or conformance have been incorporated into this document:

- 6336 1. Section 3.1.8, 5.2.4, and 13.1.5.4 - Clients and IPP objects MUST support version 1.1 conformance  
6337 requirements and SHOULD support version 1.0 conformance requirements. Also clarified that IPP  
6338 Printers MUST accept '1.1' requests and SHOULD accept '1.x' requests. Issue 33 and Issue 36
- 6339 2. Section 3.2.1.1 and section 4.4.32 - changed the "compression" operation and the "compression-  
6340 supported" Printer Description attribute from OPTIONAL to REQUIRED. Issue 28
- 6341 3. Sections 3.2.1.2 and 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED,  
6342 so that "job-state-reasons" MUST be returned in create operation responses. Issue 30
- 6343 4. Sections 3.2.4, 3.3.1, 4.4.16, and 16 - changed Create-Job/Send-Document so that they MAY be  
6344 implemented while only supporting one document jobs. Added the "multiple-document-jobs-  
6345 supported" boolean Printer Description attribute to indicate whether Create-Job/Send-Document  
6346 support multiple document jobs or not. Added to the Directory schema. Issue 34
- 6347 5. Section 4.1.9 - deleted 'text/plain; charset=iso-10646-ucs-2', since binary is not legal with the 'text'  
6348 type.
- 6349 6. Section 4.2.4 - indicated that the "multiple-document-handling" Job Template attribute MUST be  
6350 supported with at least one value if the Printer supports multiple documents per job Issue 34
- 6351 7. Section 4.3.7.2 - indicated that the 'job-restartable' job state reason SHOULD be supported if the  
6352 Restart-Job operation is supported. Issue 30
- 6353 8. Section 4.3.8 - changed "job-state-reasons" from RECOMMENDED to REQUIRED. Issue 30
- 6354 9. Section 4.3.8 - clarified the conformance of the values of the "job-state-reasons" attribute by  
6355 copying conformance requirements from other sections of the document so that it is clear from  
6356 reading the definition of "job-state-reasons" which values MUST or SHOULD be supported. The  
6357 'none', 'unsupported-compression', and 'unsupported-document-format' values MUST be supported.  
6358 The "job-hold-until-specified" SHOULD be specified if the "job-hold-until" Job Template is  
6359 supported. The following values SHOULD be supported: 'job-canceled-by-user', 'aborted-by-  
6360 system', and 'job-completed-successfully'. The 'job-canceled-by-operator' SHOULD be supported if

- 6361 the implementation permits canceling by other than the job owner. The 'job-canceled-at-device'  
6362 SHOULD be supported if the device supports canceling jobs at the console. The 'job-completed-  
6363 with-warnings' SHOULD be supported, if the implementation detects warnings. The 'job-  
6364 completed-with-errors' SHOULD be supported if the implementation detects errors. The 'job-  
6365 restartable' SHOULD be supported if the Restart-Job operation is supported. Issue 30  
6366 10. Section 4.3.14 - changed the "time-at-creation", "time-at-processing", and "time-at-completed"  
6367 Event Time Job Description attributes from OPTIONAL to REQUIRED. Issue 17  
6368 11. Section 4.3.14.4 - added the REQUIRED "job-printer-up-time (integer(1:MAX))" Job Description  
6369 attribute as an alias for "printer-up-time" to reduce number of operations to get job times. Issue 17  
6370 12. Section 4.4.2 - added the REQUIRED "uri-authentication-supported (1setOf type2 keyword)"  
6371 Printer Description attribute to describe the Client Authentication used by each Printer URI. Issue 2  
6372 13. Section 4.4.12 - changed "printer-state-reasons" Printer Description attribute from OPTIONAL to  
6373 REQUIRED. Issue 30  
6374 14. Section 4.4.12 - changed 'paused' value of "printer-state-reasons" to MUST if Pause-Printer  
6375 operation is supported. Issue 30  
6376 15. Section 4.4.14 - added the REQUIRED "ipp-versions-supported (1setOf keyword)" Printer  
6377 Description attribute, since IPP/1.1 Printers do not have to support version '1.0' conformance  
6378 requirements. Issue 36  
6379 16. Section 4.4.16 - added the "multiple-document-jobs-supported (boolean)" Printer Description  
6380 attribute so that a client can tell whether a Printer that supports Create-Job/Send-Document supports  
6381 multiple document jobs or not. This attribute is REQUIRED if the Create-Job operation is  
6382 supported. Issue 34  
6383 17. Section 4.4.24 - changed the "queued-job-count" Printer Description attribute from  
6384 RECOMMENDED to REQUIRED. Issue 29  
6385 18. Section 4.4.32 - changed "compression-supported (1setOf type3 keyword)" Printer Description  
6386 attribute from OPTIONAL to REQUIRED. Issue 28  
6387 19. Section 5.1 - changed the client security requirements from RECOMMENDED non-standards track  
6388 SSL3 to MUST support Client Authentication as defined in the IPP/1.1 Encoding and Transport  
6389 document [IPP-PRO]. A client SHOULD support Operation Privacy and Server Authentication as  
6390 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. Issue 32  
6391 20. Section 5.2.7 - changed the IPP object security requirements from OPTIONAL non-standards track  
6392 SSL3 to SHOULD contain support for Client Authentication as defined in the IPP/1.1 Encoding and  
6393 Transport document [IPP-PRO]. A Printer implementation MAY allow an administrator to  
6394 configure the Printer so that all, some, or none of the users are authenticated. An IPP Printer  
6395 implementation SHOULD contain support for Operation Privacy and Server Authentication as  
6396 defined in the IPP/1.1 Encoding and Transport document [IPP-PRO]. A Printer implementation  
6397 MAY allow an administrator to configure the degree of support for Operation Privacy and Server  
6398 Authentication. Security MUST NOT be compromised when the client supplies a lower version-  
6399 number in a request. Issue 32

6400 See also the "IPP/1.1 Encoding and Transport" [IPP-PRO] document for differences between IPP/1.0  
6401 [RFC2565] and IPP/1.1 [IPP-PRO].
