Internet Printing Protocol/1.1: Encoding and Transport

16 Status of this Memo

17 This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of [RFC2026]. Internet-Drafts are
18 working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may
19 also distribute working documents as Internet-Drafts.

20 Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other
21 documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in
22 progress".

23 The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/1id-abstracts.txt>

24 The list of Internet-Draft Shadow Directories can be accessed as <http://www.ietf.org/shadow.html>.

27 Abstract

28 This document is one of a set of documents, which together describe all aspects of a new Internet Printing Protocol (IPP). IPP is
29 an application level protocol that can be used for distributed printing using Internet tools and technologies. This document
30 defines the rules for encoding IPP operations and IPP attributes into a new Internet mime media type called "application/ipp".
31 This document also defines the rules for transporting over HTTP a message body whose Content-Type is "application/ipp". This
32 document defines a new scheme named 'ipp' for identifying IPP printers and jobs. Finally, this document defines rules for
33 supporting IPP/1.0 Clients and Printers.

34 The full set of IPP documents includes:

- 35 Design Goals for an Internet Printing Protocol [~~rfe2567~~][RFC2567]
- 36 Rationale for the Structure and Model and Protocol for the Internet Printing Protocol [~~rfe2568~~][RFC2568]
- 37 Internet Printing Protocol/1.1: Model and Semantics [ipp-mod]
- 38 Internet Printing Protocol/1.1: Encoding and Transport (this document)
- 39 Internet Printing Protocol/1.1: Implementer's Guide [ipp-iig]
- 40 Mapping between LPD and IPP Protocols [~~rfe2069~~][RFC2069]

41 The document, "Design Goals for an Internet Printing Protocol", takes a broad look at distributed printing functionality, and it
42 enumerates real-life scenarios that help to clarify the features that need to be included in a printing protocol for the Internet. It
43 identifies requirements for three types of users: end users, operators, and administrators. It calls out a subset of end user
44 requirements that are satisfied in IPP/1.1. ~~Operator and administrator requirements are out of scope for version 1.1.~~ A few
45 OPTIONAL operator operations have been added to IPP/1.1.

46 The document, "Rationale for the Structure and Model and Protocol for the Internet Printing Protocol", describes IPP from a high
47 level view, defines a roadmap for the various documents that form the suite of IPP specification documents, and gives
48 background and rationale for the IETF working group's major decisions.

49 The document, "Internet Printing Protocol/1.1: Model and Semantics", describes a simplified model with abstract objects, their
50 attributes, and their operations that are independent of encoding and transport. It introduces a Printer and a Job object. The Job
51 object optionally supports multiple documents per Job. It also addresses security, internationalization, and directory issues.

52 The document "Internet Printing Protocol/1.1: Implementer's Guide", gives advice to implementers of IPP clients and IPP
53 objects.

54 The document "Mapping between LPD and IPP Protocols" gives some advice to implementers of gateways between IPP and
55 LPD (Line Printer Daemon) implementations.

99 **1. Introduction**

100 This document contains the rules for encoding IPP operations and describes two layers: the transport layer and the operation
101 layer.

102 The transport layer consists of an HTTP/1.1 request or response. RFC 2068 [[rfc2068](#)][RFC2068] describes HTTP/1.1. This
103 document specifies the HTTP headers that an IPP implementation supports.

104 The operation layer consists of a message body in an HTTP request or response. The document "Internet Printing Protocol/1.1:
105 Model and Semantics" [ipp-mod] defines the semantics of such a message body and the supported values. This document
106 specifies the encoding of an IPP operation. The aforementioned document [ipp-mod] is henceforth referred to as the "IPP model
107 document"

108 2. Conformance Terminology

109 The key words "MUST", "MUST NOT", "REQUIRED", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and
110 "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [~~rfc2119~~;[RFC2119](#)].

111 3. Encoding of the Operation Layer

112 The operation layer MUST contain a single operation request or operation response. Each request or response consists of a
113 sequence of values and attribute groups. Attribute groups consist of a sequence of attributes each of which is a name and value.
114 Names and values are ultimately sequences of octets

115 The encoding consists of octets as the most primitive type. There are several types built from octets, but three important types are
116 integers, character strings and octet strings, on which most other data types are built. Every character string in this encoding
117 MUST be a sequence of characters where the characters are associated with some charset and some natural language. A character
118 string MUST be in "reading order" with the first character in the value (according to reading order) being the first character in
119 the encoding. A character string whose associated charset is US-ASCII whose associated natural language is US English is
120 henceforth called a US-ASCII-STRING. A character string whose associated charset and natural language are specified in a
121 request or response as described in the model document is henceforth called a LOCALIZED-STRING. An octet string MUST be
122 in "IPP model document order" with the first octet in the value (according to the IPP model document order) being the first octet
123 in the encoding. Every integer in this encoding MUST be encoded as a signed integer using two's-complement binary encoding
124 with big-endian format (also known as "network order" and "most significant byte first"). The number of octets for an integer
125 MUST be 1, 2 or 4, depending on usage in the protocol. Such one-octet integers, henceforth called SIGNED-BYTE, are used for
126 the version-number and tag fields. Such two-byte integers, henceforth called SIGNED-SHORT are used for the operation-id,
127 status-code and length fields. Four byte integers, henceforth called SIGNED-INTEGER, are used for values fields and the
128 sequence number.

129 The following two sections present the operation layer in two ways

- 130 - informally through pictures and description
- 131 - formally through Augmented Backus-Naur Form (ABNF), as specified by RFC 2234 [[RFC2234](#)]

132 [~~rfc2234~~]

133

134 **4.13.1 Picture of the Encoding**

135 The encoding for an operation request or response consists of:

136	-----		
137		version-number	2 bytes - required
138	-----		
139		operation-id (request)	2 bytes - required
140		or	
141		status-code (response)	
142	-----		
143		request-id	4 bytes - required
144	-----		
145		xxx-attributes-tag	1 byte -0 or more
146	-----		
147		xxx-attribute-sequence	n bytes
148	-----		
149		end-of-attributes-tag	1 byte - required
150	-----		
151		data	q bytes - optional
152	-----		

153 The xxx-attributes-tag and xxx-attribute-sequence represents four different values of "xxx", namely, operation, job, printer and
154 unsupported. The xxx-attributes-tag and an xxx-attribute-sequence represent attribute groups in the model document. The xxx-
155 attributes-tag identifies the attribute group and the xxx-attribute-sequence contains the attributes.

156 The expected sequence of xxx-attributes-tag and xxx-attribute-sequence is specified in the IPP model document for each
157 operation request and operation response.

158 A request or response SHOULD contain each xxx-attributes-tag defined for that request or response even if there are no attributes
159 except for the unsupported-attributes-tag which SHOULD be present only if the unsupported-attribute-sequence is non-empty. A
160 receiver of a request MUST be able to process as equivalent empty attribute groups:

- 161 a) an xxx-attributes-tag with an empty xxx-attribute-sequence,
- 162 b) an expected but missing xxx-attributes-tag.

163 The data is omitted from some operations, but the end-of-attributes-tag is present even when the data is omitted. Note, the xxx-
164 attributes-tags and end-of-attributes-tag are called 'delimiter-tags'. Note: the xxx-attribute-sequence, shown above may consist of
165 0 bytes, according to the rule below.

166 An xxx-attributes-sequence consists of zero or more compound-attributes.

167	-----		
168		compound-attribute	s bytes - 0 or more
169	-----		

170 A compound-attribute consists of an attribute with a single value followed by zero or more additional values.

171 Note: a 'compound-attribute' represents a single attribute in the model document. The 'additional value' syntax is for attributes
172 with 2 or more values.

173 Each attribute consists of:

174	-----		
175		value-tag	1 byte
176	-----		
177		name-length (value is u)	2 bytes
178	-----		
179		name	u bytes
180	-----		
181		value-length (value is v)	2 bytes
182	-----		
183		value	v bytes
184	-----		

185 An additional value consists of:

186	-----		
187		value-tag	1 byte
188	-----		
189		name-length (value is 0x0000)	2 bytes
190	-----		
191		value-length (value is w)	2 bytes
192	-----		
193		value	w bytes
194	-----		

-0 or more

195
196 Note: an additional value is like an attribute whose name-length is 0.

197 From the standpoint of a parsing loop, the encoding consists of:

198	-----		
199		version-number	2 bytes - required
200	-----		
201		operation-id (request)	2 bytes - required
202		or	
203		status-code (response)	
204	-----		
205		request-id	4 bytes - required
206	-----		
207		tag (delimiter-tag or value-tag)	1 byte
208	-----		
209		empty or rest of attribute	x bytes
210	-----		
211		end-of-attributes-tag	2 bytes - required
212	-----		
213		data	y bytes - optional
214	-----		
215			

216 The value of the tag determines whether the bytes following the tag are:

- 217 - attributes
- 218 - data
- 219 - the remainder of a single attribute where the tag specifies the type of the value.

220 3.2 Syntax of Encoding

221 The syntax below is ABNF [rfc2234][RFC2234] except 'strings of literals' MUST be case sensitive. For example 'a' means lower
 222 case 'a' and not upper case 'A'. In addition, SIGNED-BYTE and SIGNED-SHORT fields are represented as '%x' values which
 223 show their range of values.

```

224 ipp-message = ipp-request / ipp-response
225 ipp-request = version-number operation-id request-id
226             *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
227 ipp-response = version-number status-code request-id
228             *(xxx-attributes-tag xxx-attribute-sequence) end-of-attributes-tag data
229 xxx-attribute-sequence = *compound-attribute
230
231 xxx-attributes-tag = operation-attributes-tag / job-attributes-tag /
232                   printer-attributes-tag / unsupported-attributes-tag
233
234 version-number = major-version-number minor-version-number
235 major-version-number = SIGNED-BYTE ; initially %d1
236 minor-version-number = SIGNED-BYTE ; initially %d0
237
238 operation-id = SIGNED-SHORT ; mapping from model defined below
239 status-code = SIGNED-SHORT ; mapping from model defined below
240 request-id = SIGNED-INTEGER ; whose value is > 0
241
242 compound-attribute = attribute *additional-values
243
244 attribute = value-tag name-length name value-length value
245 additional-values = value-tag zero-name-length value-length value
246
247 name-length = SIGNED-SHORT ; number of octets of 'name'
248 name = LALPHA *( LALPHA / DIGIT / "-" / "_" / "." )
249 value-length = SIGNED-SHORT ; number of octets of 'value'
250 value = OCTET-STRING
251
252 data = OCTET-STRING
253
254 zero-name-length = %x00.00 ; name-length of 0
255 operation-attributes-tag = %x01 ; tag of 1
256 job-attributes-tag = %x02 ; tag of 2
257 printer-attributes-tag = %x04 ; tag of 4
258 unsupported- attributes-tag = %x05 ; tag of 5
259 end-of-attributes-tag = %x03 ; tag of 3
260 value-tag = %x10-FF
261
262 SIGNED-BYTE = BYTE
263 SIGNED-SHORT = 2BYTE
264 SIGNED-INTEGER = 4BYTE
265 DIGIT = %x30-39 ; "0" to "9"
266 LALPHA = %x61-7A ; "a" to "z"
267 BYTE = %x00-FF
268 OCTET-STRING = *BYTE
269

```

270 The syntax allows an xxx-attributes-tag to be present when the xxx-attribute-sequence that follows is empty. The syntax is
 271 defined this way to allow for the response of Get-Jobs where no attributes are returned for some job-objects. Although it is

272 RECOMMENDED that the sender not send an xxx-attributes-tag if there are no attributes (except in the Get-Jobs response just
273 mentioned), the receiver MUST be able to decode such syntax.

274 **1.3.3 Version-number**

275 The version-number MUST consist of a major and minor version-number, each of which MUST be represented by a SIGNED-
276 BYTE. The protocol described in this document MUST have a major version-number of 1 (0x01) and a minor version-number of
277 1 (0x01). The ABNF for these two bytes MUST be %x01.01.

278 **1.4.3.4 Operation-id**

279 Operation-ids are defined as enums in the model document. An operation-ids enum value MUST be encoded as a SIGNED-
280 SHORT.

281 Note: the values 0x4000 to 0xFFFF are reserved for private extensions.

282 **1.5.3.5 Status-code**

283 Status-codes are defined as enums in the model document. A status-code enum value MUST be encoded as a SIGNED-SHORT.

284 The status-code is an operation attribute in the model document. In the protocol, the status-code is in a special position, outside of
285 the operation attributes.

286 If an IPP status-code is returned, then the HTTP Status-Code MUST be 200 (successful-ok). With any other HTTP Status-Code
287 value, the HTTP response MUST NOT contain an IPP message-body, and thus no IPP status-code is returned.

288 **1.6.3.6 Request-id**

289 The request-id allows a client to match a response with a request. This mechanism is unnecessary in HTTP, but may be useful
290 when application/ipp entity bodies are used in another context.

291 The request-id in a response MUST be the value of the request-id received in the corresponding request. A client can set the
292 request-id in each request to a unique value or a constant value, such as 1, depending on what the client does with the request-id
293 returned in the response. The value of the request-id MUST be greater than zero.

294 **1.7.3.7 Tags**

295 There are two kinds of tags:

- 296 - delimiter tags: delimit major sections of the protocol, namely attributes and data
- 297 - value tags: specify the type of each attribute value

298 **3.7.1 Delimiter Tags**

299 The following table specifies the values for the delimiter tags:

Tag Value (Hex)	Delimiter
0x00	reserved
0x01	operation-attributes-tag
0x02	job-attributes-tag
0x03	end-of-attributes-tag
0x04	printer-attributes-tag
0x05	unsupported-attributes-tag
0x06-0x0e	reserved for future delimiters
0x0F	reserved for future chunking-end-of-attributes-tag

300 When an xxx-attributes-tag occurs in the protocol, it MUST mean that zero or more following attributes up to the next delimiter
301 tag are attributes belonging to group xxx as defined in the model document, where xxx is operation, job, printer, unsupported.

302 Doing substitution for xxx in the above paragraph, this means the following. When an operation-attributes-tag occurs in the
303 protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag are operation attributes as defined
304 in the model document. When an job-attributes-tag occurs in the protocol, it MUST mean that the zero or more following
305 attributes up to the next delimiter tag are job attributes or job template attributes as defined in the model document. When a
306 printer-attributes-tag occurs in the protocol, it MUST mean that the zero or more following attributes up to the next delimiter tag
307 are printer attributes as defined in the model document. When an unsupported-attributes-tag occurs in the protocol, it MUST
308 mean that the zero or more following attributes up to the next delimiter tag are unsupported attributes as defined in the model
309 document.

310 The operation-attributes-tag and end-of-attributes-tag MUST each occur exactly once in an operation. The operation-attributes-
311 tag MUST be the first tag delimiter, and the end-of-attributes-tag MUST be the last tag delimiter. If the operation has a
312 document-content group, the document data in that group MUST follow the end-of-attributes-tag.

313 Each of the other three xxx-attributes-tags defined above is OPTIONAL in an operation and each MUST occur at most once in
314 an operation, except for job-attributes-tag in a Get-Jobs response which may occur zero or more times.

315 The order and presence of delimiter tags for each operation request and each operation response MUST be that defined in the
316 model document. For further details, see section 3.9 "(Attribute) Name" and section 11 "Appendix A: Protocol Examples".

317 A Printer MUST treat the reserved delimiter tags differently from reserved value tags so that the Printer knows that there is an
318 entire attribute group that it doesn't understand as opposed to a single value that it doesn't understand.

319 4.1.23.7.2 Value Tags

320 The remaining tables show values for the value-tag, which is the first octet of an attribute. The value-tag specifies the type of the
321 value of the attribute. The following table specifies the "out-of-band" values for the value-tag.

Tag Value (Hex)	Meaning
0x10	unsupported
0x11	reserved for future 'default'
0x12	unknown
0x13	no-value
0x14-0x1F	reserved for future "out-of-band" values.

322 The "unsupported" value MUST be used in the attribute-sequence of an error response for those attributes which the printer does
323 not support. The "default" value is reserved for future use of setting value back to their default value. The "unknown" value is
324 used for the value of a supported attribute when its value is temporarily unknown. The "no-value" value is used for a supported

325 attribute to which no value has been assigned, e.g. "job-k-octets-supported" has no value if an implementation supports this
 326 attribute, but an administrator has not configured the printer to have a limit.

327 The following table specifies the integer values for the value-tag:

Tag Value (Hex)	Meaning
0x20	reserved
0x21	integer
0x22	boolean
0x23	enum
0x24-0x2F	reserved for future integer types

328 NOTE: 0x20 is reserved for "generic integer" if it should ever be needed.

329 The following table specifies the octetString values for the value-tag:

Tag Value (Hex)	Meaning
0x30	octetString with an unspecified format
0x31	dateTime
0x32	resolution
0x33	rangeOfInteger
0x34	reserved for collection (in the future)
0x35	textWithLanguage
0x36	nameWithLanguage
0x37-0x3F	reserved for future octetString types

330 The following table specifies the character-string values for the value-tag:

Tag Value (Hex)	Meaning
0x40	reserved
0x41	textWithoutLanguage
0x42	nameWithoutLanguage
0x43	reserved
0x44	keyword
0x45	uri
0x46	uriScheme
0x47	charset
0x48	naturalLanguage
0x49	mimeMediaType
0x4A-0x5F	reserved for future character string types

331 NOTE: 0x40 is reserved for "generic character-string" if it should ever be needed.

332 NOTE: an attribute value always has a type, which is explicitly specified by its tag; one such tag value is
 333 "nameWithoutLanguage". An attribute's name has an implicit type, which is keyword.

334 The values 0x60-0xFF are reserved for future types. There are no values allocated for private extensions. A new type MUST be
 335 registered via the type 2 registration process [ipp-mod].

336 The tag 0x7F is reserved for extending types beyond the 255 values available with a single byte. A tag value of 0x7F MUST
 337 signify that the first 4 bytes of the value field are interpreted as the tag value. Note, this future extension doesn't affect parsers

338 that are unaware of this special tag. The tag is like any other unknown tag, and the value length specifies the length of a value
339 which contains a value that the parser treats atomically. All these 4 byte tag values are currently unallocated except that the
340 values 0x40000000-0x7FFFFFFF are reserved for experimental use.

341 **1.83.8 Name-Length**

342 The name-length field MUST consist of a SIGNED-SHORT. This field MUST specify the number of octets in the name field
343 which follows the name-length field, excluding the two bytes of the name-length field.

344 If a name-length field has a value of zero, the following name field MUST be empty, and the following value MUST be treated as
345 an additional value for the preceding attribute. Within an attribute-sequence, if two attributes have the same name, the first
346 occurrence MUST be ignored. The zero-length name is the only mechanism for multi-valued attributes.

347 **1.93.9 (Attribute) Name**

348 Some operation elements are called parameters in the model document [ipp-mod]. They MUST be encoded in a special position
349 and they MUST NOT appear as an operation attributes. These parameters are:

- 350 - "version-number": The parameter named "version-number" in the IPP model document MUST become the "version-
351 number" field in the operation layer request or response.
- 352 - "operation-id": The parameter named "operation-id" in the IPP model document MUST become the "operation-id" field
353 in the operation layer request.
- 354 - "status-code": The parameter named "status-code" in the IPP model document MUST become the "status-code" field in
355 the operation layer response.
- 356 - "request-id": The parameter named "request-id" in the IPP model document MUST become the "request-id" field in the
357 operation layer request or response.

358 All Printer and Job objects are identified by a Uniform Resource Identifier (URI) [[#fe2396](#)][[RFC2396](#)] so that they can be
359 persistently and unambiguously referenced. The notion of a URI is a useful concept, however, until the notion of URI is more
360 stable (i.e., defined more completely and deployed more widely), it is expected that the URIs used for IPP objects will actually
361 be URLs [[#fe1738](#)][[RFC1738](#)] [[#fe1808](#)][[RFC1808](#)]. Since every URL is a specialized form of a URI, even though the more
362 generic term URI is used throughout the rest of this document, its usage is intended to cover the more specific notion of URL as
363 well.

364 Some operation elements are encoded twice, once as the request-URI on the HTTP Request-Line and a second time as a
365 REQUIRED operation attribute in the application/ipp entity. These attributes are the target URI for the operation and are called
366 printer-uri and job-uri. Note: The target URI is included twice in an operation referencing the same IPP object, but the two URIs
367 NEED NOT be literally identical. One can be a relative URI and the other can be an absolute URI. HTTP/1.1 allows clients to
368 generate and send a relative URI rather than an absolute URI. A relative URI identifies a resource with the scope of the HTTP
369 server, but does not include scheme, host or port. The following statements characterize how URLs should be used in the
370 mapping of IPP onto HTTP/1.1:

- 371 1. Although potentially redundant, a client MUST supply the target of the operation both as an operation attribute and as a
372 URI at the HTTP layer. The rationale for this decision is to maintain a consistent set of rules for mapping
373 application/ipp to possibly many communication layers, even where URLs are not used as the addressing mechanism in
374 the transport layer.
- 375 2. Even though these two URLs might not be literally identical (one being relative and the other being absolute), they MUST
376 both reference the same IPP object.

- 377 3. The URI in the HTTP layer is either relative or absolute and is used by the HTTP server to route the HTTP request to the
 378 correct resource relative to that HTTP server. The HTTP server need not be aware of the URI within the operation
 379 request.
 380 4. Once the HTTP server resource begins to process the HTTP request, it might get the reference to the appropriate IPP
 381 Printer object from either the HTTP URI (using to the context of the HTTP server for relative URLs) or from the URI
 382 within the operation request; the choice is up to the implementation.
 383 5. HTTP URIs can be relative or absolute, but the target URI in the operation MUST be an absolute URI.

384 The model document arranges the remaining attributes into groups for each operation request and response. Each such group
 385 MUST be represented in the protocol by an xxx-attribute-sequence preceded by the appropriate xxx-attributes-tag (See the table
 386 below and section 11 "Appendix A: Protocol Examples"). In addition, the order of these xxx-attributes-tags and xxx-attribute-
 387 sequences in the protocol MUST be the same as in the model document, but the order of attributes within each xxx-attribute-
 388 sequence MUST be unspecified. The table below maps the model document group name to xxx-attributes-sequence:

Model Document Group	xxx-attributes-sequence
Operation Attributes	operations-attributes-sequence
Job Template Attributes	job-attributes-sequence
Job Object Attributes	job-attributes-sequence
Unsupported Attributes	unsupported- attributes-sequence
Requested Attributes (Get-Job-Attributes)	job-attributes-sequence
Requested Attributes (Get-Printer-Attributes)	printer-attributes-sequence
Document Content	in a special position as described above

389 If an operation contains attributes from more than one job object (e.g. Get-Jobs response), the attributes from each job object
 390 MUST be in a separate job-attribute-sequence, such that the attributes from the ith job object are in the ith job-attribute-sequence.
 391 See Section 11 "Appendix A: Protocol Examples" for table showing the application of the rules above.

392 **1.103.10 Value Length**

393 Each attribute value MUST be preceded by a SIGNED-SHORT, which MUST specify the number of octets in the value which
 394 follows this length, exclusive of the two bytes specifying the length.

395 For any of the types represented by binary signed integers, the sender MUST encode the value in exactly four octets.

396 For any of the types represented by character-strings, the sender MUST encode the value with all the characters of the string and
 397 without any padding characters.

398 If a value-tag contains an "out-of-band" value, such as "unsupported", the value-length MUST be 0 and the value empty — the
 399 value has no meaning when the value-tag has an "out-of-band" value.

400 **1.113.11 (Attribute) Value**

401 The syntax types and most of the details of their representation are defined in the IPP model document. The table below augments
 402 the information in the model document, and defines the syntax types from the model document in terms of the 5 basic types
 403 defined in section 3 "Encoding of the Operation Layer". The 5 types are US-ASCII-STRING, LOCALIZED-STRING,
 404 SIGNED-INTEGER, SIGNED-SHORT, SIGNED-BYTE, and OCTET-STRING.

Syntax of Attribute Value	Encoding
textWithoutLanguage, nameWithoutLanguage	LOCALIZED-STRING.

Syntax of Attribute Value**Encoding**

textWithLanguage

OCTET_STRING consisting of 4 fields:

- a) a SIGNED-SHORT which is the number of octets in the following field
- b) a value of type natural-language,
- c) a SIGNED-SHORT which is the number of octets in the following field,
- d) a value of type textWithoutLanguage.

The length of a textWithLanguage value MUST be 4 + the value of field a + the value of field c.

nameWithLanguage

OCTET_STRING consisting of 4 fields:

- a) a SIGNED-SHORT which is the number of octets in the following field
- b) a value of type natural-language,
- c) a SIGNED-SHORT which is the number of octets in the following field
- d) a value of type nameWithoutLanguage.

The length of a nameWithLanguage value MUST be 4 + the value of field a + the value of field c.

charset, naturalLanguage,
mimeMediaType, keyword, uri, and
uriScheme

US-ASCII-STRING.

boolean

SIGNED-BYTE where 0x00 is 'false' and 0x01 is 'true'.

integer and enum

a SIGNED-INTEGER.

~~dateTime~~~~OCTET_STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [rfe1903].~~dateTimeOCTET_STRING consisting of eleven octets whose contents are defined by "DateAndTime" in RFC 1903 [RFC1903].

resolution

OCTET_STRING consisting of nine octets of 2 SIGNED-INTEGERS followed by a SIGNED-BYTE. The first SIGNED-INTEGER contains the value of cross feed direction resolution. The second SIGNED-INTEGER contains the value of feed direction resolution. The SIGNED-BYTE contains the units value.

rangeOfInteger

Eight octets consisting of 2 SIGNED-INTEGERS. The first SIGNED-INTEGER contains the lower bound and the second SIGNED-INTEGER contains the upper bound.

1setOf X

Encoding according to the rules for an attribute with more than 1 value. Each value X is encoded according to the rules for encoding its type.

octetString

OCTET-STRING

405 The type of the value in the model document determines the encoding in the value and the value of the value-tag.

4.123.12 Data

The data part MUST include any data required by the operation

4. Encoding of Transport Layer

HTTP/1.1 [RFC2068] is the transport layer for this protocol.

The operation layer has been designed with the assumption that the transport layer contains the following information:

- the URI of the target job or printer operation

- the total length of the data in the operation layer, either as a single length or as a sequence of chunks each with a length.

It is REQUIRED that a printer implementation support HTTP over the IANA assigned Well Known Port 631 (the IPP default port), though a printer implementation may support HTTP over some other port as well.

Each HTTP operation MUST use the POST method where the request-URI is the object target of the operation, and where the "Content-Type" of the message-body in each request and response MUST be "application/ipp". The message-body MUST contain the operation layer and MUST have the syntax described in section 3.2 "Syntax of Encoding". A client implementation MUST adhere to the rules for a client described for HTTP1.1 [RFC2068]. A printer (server) implementation MUST adhere the rules for an origin server described for HTTP1.1 [RFC2068].

An IPP server sends a response for each request that it receives. If an IPP server detects an error, it MAY send a response before it has read the entire request. If the HTTP layer of the IPP server completes processing the HTTP headers successfully, it MAY send an intermediate response, such as "100 Continue", with no IPP data before sending the IPP response. A client MUST expect such a variety of responses from an IPP server. For further information on HTTP/1.1, consult the HTTP documents [RFC2068].

An HTTP server MUST support chunking for IPP requests, and an IPP client MUST support chunking for IPP responses according to HTTP/1.1 [RFC2068]. Note: this rule causes a conflict with non-compliant implementations of HTTP/1.1 that don't support chunking for POST methods, and this rule may cause a conflict with non-compliant implementations of HTTP/1.1 that don't support chunking for CGI scripts

5. IPP URL Scheme

The IPP/1.1 specification document defines a new scheme 'ipp' as the value of a URL that identifies either an IPP printer object or an IPP job object. The IPP attributes using the 'ipp' scheme are specified below. Because the HTTP layer does not support the 'ipp' scheme, a client MUST map 'ipp' URLs to 'http' URLs, and then follows the HTTP [RFC2068] rules for constructing a Request-Line and HTTP headers. The mapping is simple because the 'ipp' scheme implies all of the same protocol semantics as that of the 'http' scheme [RFC2068], except that it represents a print service and the implicit (default) port number that clients use to connect to a server is port 631.

In the remainder of this section the term 'ipp-URL' means a URL whose scheme is 'ipp' and whose implicit (default) port is 631. The term 'http-URL' means a URL whose scheme is 'http', and the term 'https-URL' means a URL whose scheme is 'https',

A client and an IPP object (i.e. the server) MUST support the ipp-URL value in the following IPP attributes.

job attributes:

- job-uri

- job-printer-uri

printer attributes:

443 printer-uri-supported
 444 operation attributes:
 445 job-uri
 446 printer-uri
 447

448 Each of the above attributes identifies a printer or job object. The ipp-URL is intended as the value of the attributes in this list,
 449 and for no other attributes. All of these attributes have a syntax type of 'uri', but there are attributes with a syntax type of 'uri' that
 450 do not use the 'ipp' scheme, e.g. 'job-more-info'.
 451

452 If a printer registers its URL with a directory service, the printer MUST register an ipp-URL.

453 User interfaces are beyond the scope of this document. But if software exposes the ipp-URL values of any of the above five
 454 attributes to a human user, it is REQUIRED that the human see the ipp-URL as is.
 455

456 When a client sends a request, it MUST convert a target ipp-URL to a target http-URL for the HTTP layer according to the
 457 following rules:

- 458 1. change the 'ipp' scheme to 'http'
- 459 2. add an explicit port 631 if the URL does not contain an explicit port. Note: port 631 is the IANA assigned Well Known
 460 Port for the 'ipp' scheme.

461 The client MUST use the target http-URL in both the HTTP Request-Line and HTTP headers, as specified by
 462 HTTP[RFC2068][RFC2069]. However, the client MUST use the target ipp-URL for the value of the "printer-uri" or "job-uri"
 463 operation attribute within the application/ipp body of the request. The server MUST use the ipp-URL for the value of the
 464 "printer-uri", "job-uri" or "printer-uri-supported" attributes within the application/ipp body of the response.
 465

466 For example, when an IPP client sends a request directly (i.e. no proxy) to an ipp-URL "ipp://myhost.com/myprinter/myqueue",
 467 it opens a TCP connection to port 631 (the ipp implicit port) on the host "myhost.com" and sends the following data:
 468

```
469 POST /myprinter/myqueue HTTP/1.1
470 Host: myhost.com:631
471 Content-type: application/ipp
472 Transfer-Encoding: chunked
473 ...
474 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
475         (encoded in application/ipp message body)
476 ...
```

477 As another example, when an IPP client sends the same request as above via a proxy "myproxy.com", it opens a TCP connection
 478 to the proxy port 8080 on the proxy host "myproxy.com" and sends the following data:
 479

```
480 POST http://myhost.com:631/myprinter/myqueue HTTP/1.1
481 Host: myhost.com:631
482 Content-type: application/ipp
483 Transfer-Encoding: chunked
484 ...
485 "printer-uri" "ipp://myhost.com/myprinter/myqueue"
486         (encoded in application/ipp message body)
487 ...
```

488 The proxy then connects to the IPP origin server with headers that are the same as the "no-proxy" example above.
 489
 490

491 ~~6. Compatibility with IPP/1.0 Implementations~~

492 ~~IPP/1.1 server implementations SHOULD interoperate with IPP/1.0 client implementations, as defined in [rfc 2565] and [rfc~~
493 ~~2566] documents. If an IPP/1.1 server implementation does not support an IPP/1.0 client, it MUST return the error 'server-error-~~
494 ~~version-not-supported' and the version in the response MUST be a version that the server supports and SHOULD be a version~~
495 ~~that is closest to the clients version in the request.~~

496 ~~The following are specific rules of interoperability for an IPP/1.1 server that supports IPP/1.0 clients.~~

497 ~~-If a server receives an IPP/1.0 request, it MUST return an IPP/1.0 response. That is, it MUST support both an http URL and~~
498 ~~an https URL in the target "printer-uri" and "job-uri" operation attributes in a request. The rules for attributes in a~~
499 ~~response is covered in the next two bullet items.~~

500 ~~-When a server returns the printer attribute "printer-uri-supported", it MUST return all values of the attribute for an IPP/1.1~~
501 ~~request. For an IPP/1.0 request, a server MUST return a subset of the attribute values, excluding those that are ipp-~~
502 ~~URLs, and including those that are http URLs and https URLs..~~

503 ~~-The table below shows the type of URL that a server returns for the "job-uri" and "job-printer-uri" job attributes for all~~
504 ~~operations based on how the job was created.~~

505

Operation attributes for a request	Job created via			
	ipp	secure-ipp	http	https
ipp	ipp	<i>No URL returned</i>	ipp	<i>No URL returned</i>
secure-ipp	ipp	ipp	ipp	ipp
http	http	<i>No URL returned</i>	http	<i>No URL returned</i>
https	http	https	http	https

506

507 ~~-If a server registers a nonsecure ipp URL with a name service, then it MUST also register an http URL. If a printer supports~~
508 ~~a secure connection using SSL3, then it MUST register an https URL.~~

509 ~~IPP/1.1 client implementations SHOULD interoperate with IPP/1.0 server implementations. If an IPP/1.1 client receives an error~~
510 ~~'server-error-version-not-supported' and the version in the response is 1.0 and the client supports IPP/1.0, the IPP/1.1 client~~
511 ~~MUST convert the target URI (as defined in Section 4 of this document) and act as an IPP/1.0 client [rfc 2565 and rfc 2566]. If~~
512 ~~the IPP/1.1 operation was intended to be secure, the target conversion MUST result in an 'https' scheme; otherwise it is an 'http'~~
513 ~~scheme.~~

514 **6. Security Considerations**

515 The IPP Model and Semantics document [ipp-mod] discusses high level security requirements (Client Authentication, Server
516 Authentication and Operation Privacy). Client Authentication is the mechanism by which the client proves its identity to the
517 server in a secure manner. Server Authentication is the mechanism by which the server proves its identity to the client in a secure
518 manner. Operation Privacy is defined as a mechanism for protecting operations from eavesdropping.

519 **4.16.1 Security Conformance Requirements**

520 This section defines the security requirements for IPP clients and IPP objects.

521 **4.1.16.1.1 Digest Authentication**

522 IPP clients ~~MUST/SHOULD [which is to be determined in consultation with the Area Director]~~ support:

523 Digest Authentication ~~[rfe2069].~~[RFC2069].

524 MD5 and MD5-sess MUST be implemented and supported.

525 The Message Integrity feature NEED NOT be used.

526

527 IPP Printers ~~MUST/SHOULD [which is to be determined in consultation with the Area Director]~~SHOULD support:

528 Digest Authentication ~~[rfe2069].~~[RFC2069].

529 MD5 and MD5-sess MUST be implemented and supported.

530 The Message Integrity feature NEED NOT be used.

531

532 The reasons that IPP Printers SHOULD (rather than MUST) support Digest Authentication are:

533

534 1. While Client Authentication is important, there is a certain class of printer devices where it does not make sense. Specifically, a low-end device with limited ROM space and low paper throughput may not need Client Authentication. This class of device typically requires firmware designers to make trade-offs between protocols and functionality to arrive at the lowest-cost solution possible. Factored into the designer's decisions is not just the size of the code, but also the testing, maintenance, usefulness, and time-to-market impact for each feature delivered to the customer. Forcing such low-end devices to provide security in order to claim IPP/1.1 conformance would not make business sense and could potentially stall the adoption of the standard.

540

541 2. Print devices that have high-volume throughput and have available ROM space have a compelling argument to provide support for Client Authentication that safeguards the device from unauthorized access. These devices are prone to a high loss of consumables and paper if unauthorized access should occur.

544

546 **6.1.2 Transport Layer Security (TLS)**

547 IPP Printers SHOULD support ~~TLS for client authentication, server authentication and operation privacy.~~Transport Layer Security (TLS) [RFC2246] for Server Authentication and Operation Privacy. IPP Printers MAY also support TLS for Client Authentication. If an IPP Printer supports TLS, it MUST support the TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by RFC 2246 ~~[rfe2246].~~[RFC2246]. All other cipher suites are OPTIONAL. An IPP Printer MAY support Basic Authentication (described in HTTP/1.1~~[rfe-2068])~~[RFC2068]) for Client Authentication if the channel is secure. TLS with the above mandated cipher suite can provide such a secure channel.

553 If a IPP client supports TLS, it MUST support the TLS_DHE_DSS_WITH_3DES_EDE_CBC_SHA cipher suite as mandated by RFC 2246 [RFC2246]. All other cipher suites are OPTIONAL.

554

555 The IPP Model and Semantics document defines two printer attributes ("uri-authentication-supported" and "uri-security-supported") that the client can use to discover the security policy of a printer. That document also outlines IPP-specific security considerations and should be the primary reference for security implications with regard to the IPP protocol itself. For backward

557

558 compatibility with IPP version 1.0, IPP clients and printers MAY also support SSL3. This is in addition to the security required
559 in this document.

560 **4.26.2 Using IPP with TLS**

561 An initial IPP request never uses TLS. The switch to TLS occurs either because the server grants the client's request to upgrade
562 to TLS, or a server asks to switch to TLS in its response. Secure communication begins with a server's response to switch to TLS.
563 The initial connection is not secure. Any client expecting a secure connection should first use a non-sensitive operation (e.g. an
564 HTTP POST with an empty message body) to establish a secure connection before sending any sensitive data. During the TLS
565 handshake, the original session is preserved.

566 An IPP client that wants a secure connection MUST send "TLS/1.0" as one of the field-values of the HTTP/1.1 Upgrade request
567 header, e.g. "Upgrade: TLS/1.0" (see rfc2068 section 14.42). If the origin-server grants the upgrade request, it MUST respond
568 with "101 Switching Protocols", and it MUST include the header "Upgrade: TLS/1.0" to indicate what it is switching to. An IPP
569 client MUST be ready to react appropriately if the server does not grant the upgrade request. Note: the 'Upgrade header'
570 mechanism allows unsecured and secured traffic to share the same port (in this case, 631).

571 With current technology, an IPP server can indicate that it wants an upgrade only by returning "401 unauthorized" or "403
572 forbidden". A server MAY give the client an additional hint by including an "Upgrade: TLS" header in the response. When an
573 IPP client receives such a response, it can perform the request again with an Upgrade header with the "TLS/1.0" value.

574 If a server supports TLS, it SHOULD include the "Upgrade" header with the value "TLS/1.0" in response to any OPTIONS
575 request.

576 Upgrade is a hop-by-hop header (rfc2068, section 13.5.1), so each intervening proxy which supports TLS MUST also request the
577 same version of TLS/1.0 on its subsequent request. Furthermore, any caching proxy which supports TLS MUST NOT reply from
578 its cache when TLS/1.0 has been requested (although clients are still recommended to explicitly include "Cache-control: no-
579 cache").

580 Note: proxy servers may be able to request or initiate a TLS-secured connection, e.g. the outgoing or incoming firewall of a
581 trusted subnetwork.

582 **7. Interoperability with IPP/1.0 Implementations**

583 For interoperability with IPP/1.0 servers, IPP/1.1 clients SHOULD also meet the conformance requirements for clients as
584 specified in [RFC2566] and [RFC2565].

585 For interoperability with IPP/1.0 clients, IPP/1.1 objects SHOULD also meet the conformance requirements for IPP objects as
586 specified in [RFC2565] and [RFC2566].

587 **7.1 The "version-number" Parameter**

588 The following are rules regarding the "version-number" parameter (see section 3.3):

- 589 1. Clients MUST send requests containing a "version-number" parameter with a '1.1' value and SHOULD try supplying
590 alternate version numbers if they receive a 'server-error-version-not-supported' error return in a response.
- 591 2. IPP objects MUST accept requests containing a "version-number" parameter with a '1.1' value (or reject the request for
592 reasons other than 'server-error-version-not-supported').

- 593 3. IPP objects SHOULD accept any request with the major version '1' (or reject the request for reasons other than 'server-
 594 error-version-not-supported'). See [ipp-mod] "versions" sub-section.
- 595 4. In any case, security MUST NOT be compromised when a client supplies a lower "version-number" parameter in a
 596 request. For example, if an IPP/1.1 conforming Printer object accepts version '1.0' requests and is configured to enforce
 597 Digest Authentication, it MUST do the same for a version '1.0' request.

598 7.2 Security and URL Schemes

599 The following are rules regarding security, the "version-number" parameter, and the URL scheme supplied in target attributes and
 600 responses:

- 601 1. When a client supplies a request, the "printer-uri" or "job-uri" target operation attribute MUST have the same scheme as
 602 that indicated in one of the values of the "printer-uri-supported" Printer attribute.
- 603 2. When the server returns the "job-printer-uri" or "job-uri" Job Description attributes, it SHOULD return the same scheme
 604 ('ipp', 'https', 'http', etc.) that the client supplied in the "printer-uri" or "job-uri" target operation attributes in the Get-Job-
 605 Attributes or Get-Jobs request, rather than the scheme used when the job was created. However, when a client requests
 606 job attributes using the Get-Job-Attributes or Get-Jobs operations, the jobs and job attributes that the server returns
 607 depends on: (1) the security in effect when the job was created, (2) the security in effect in the query request, and (3) the
 608 security policy in force.
- 609 3. If a server registers a non-secure ipp-URL with a directory service (see [IPP-MOD] "Generic Directory Schema"
 610 Appendix), then it SHOULD also register an http-URL for interoperability with IPP/1.0 clients (see section 7).
- 611 4. In any case, security MUST NOT be compromised when a client supplies an 'http' or other non-secure URL scheme in
 612 the target "printer-uri" and "job-uri" operation attributes in a request.

662 11. Appendix A: Protocol Examples

663 11.1 Print-Job Request

664 The following is an example of a Print-Job request with job-name, copies, and sides specified. The "ipp-attribute-fidelity"
 665 attribute is set to 'true' so that the print request will fail if the "copies" or the "sides" attribute are not supported or their values are
 666 not supported.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number

667 [1.211.2](#) Print-Job Response (successful)

668 Here is an example of a successful Print-Job response to the previous Print-Job request. The printer supported the "copies" and
669 "sides" attributes and their supplied values. The status code returned is 'successful-ok'.

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0000	successful-ok	status-code
0x00000001	1	request-id

0x03	end-of-attributes	end-of-attributes-tag

670 **4.311.3 Print-Job Response (failure)**

671 Here is an example of an unsuccessful Print-Job response to the previous Print-Job request. It fails because, in this case, the
 672 printer does not support the "sides" attribute and because the value '20' for the "copies" attribute is not supported. Therefore, no
 673 job is created, and neither a "job-id" nor a "job-uri" operation attribute is returned. The error code returned is 'client-error-
 674 attributes-or-values-not-supported' (0x040B).
 675

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x040B	client-error-attributes-or-values-not-supported	status-code
0x00000001	1	request-id
0x01	start operation-attributes	operation-attribute tag

0x10	unsupported (type)	value-tag
0x0005		name-length
sides	sides	name
0x0000		value-length
0x03	end-of-attributes	end-of-attributes-tag

676 **4.411.4 Print-Job Response (success with attributes ignored)**

677 Here is an example of a successful Print-Job response to a Print-Job request like the previous Print-Job request, except that the
 678 value of 'ipp-attribute-fidelity' is false. The print request succeeds, even though, in this case, the printer supports neither the
 679 "sides" attribute nor the value '20' for the "copies" attribute. Therefore, a job is created, and both a "job-id" and a "job-uri"

680 operation attribute are returned. The unsupported attributes are also returned in an Unsupported Attributes Group. The error code
 681 returned is 'successful-ok-ignored-or-substituted-attributes' (0x0001).
 682

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0001	successful-ok-ignored-or-substituted-attributes	status-code
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag

0x0004		value-length
0x0003	pending	value
0x03	end-of-attributes	end-of-attributes-tag

683

684 **1.511.5 Print-URI Request**

685 The following is an example of Print-URI request with copies and job-name parameters:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0003	Print-URI	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag
0x0012		name-length
attributes-charset	attributes-charset	name
0x0008		value-length
us-ascii	US-ASCII	value
0x48	natural-language type	value-tag
0x001B		name-length
attributes-natural-language	attributes-natural-language	name
0x0005		value-length
en-us	en-US	value
0x45	uri type	value-tag
0x000B		name-length
printer-uri	printer-uri	name
0x0015		value-length
ipp://forest/pinetree	printer pinetree	value
0x45	uri type	value-tag
0x000C		name-length
document-uri	document-uri	name
0x0011		value-length
ftp://foo.com/foo	ftp://foo.com/foo	value
0x42	nameWithoutLanguage type	value-tag
0x0008		name-length
job-name	job-name	name
0x0006		value-length
foobar	foobar	value
0x02	start job-attributes	job-attributes-tag
0x21	integer type	value-tag
0x0006		name-length
copies	copies	name
0x0004		value-length
0x00000001	1	value
0x03	end-of-attributes	end-of-attributes-tag

686 **1.611.6 Create-Job Request**

687 The following is an example of Create-Job request with no parameters and no attributes:

Octets	Symbolic Value	Protocol field
0x0101	1.1	version-number
0x0005	Create-Job	operation-id
0x00000001	1	request-id
0x01	start operation-attributes	operation-attributes-tag
0x47	charset type	value-tag

Octets	Symbolic Value	Protocol field
0x0012		name-length

693 12. Appendix C: Registration of MIME Media Type Information for 694 "application/ipp"

695 This appendix contains the information that IANA requires for registering a MIME media type. The information following this
696 paragraph will be forwarded to IANA to register application/ipp whose contents are defined in Section 3 "Encoding of the
697 Operation Layer" in this document:

698 **MIME type name:** application

699 **MIME subtype name:** ipp

700 A Content-Type of "application/ipp" indicates an Internet Printing Protocol message body (request or response). Currently there
701 is one version: IPP/1.1, whose syntax is described in Section 3 "Encoding of the Operation Layer" of [ipp-pro], and whose
702 semantics are described in [ipp-mod].

703 **Required parameters:** none

704 **Optional parameters:** none

705 **Encoding considerations:**

706 IPP/1.1 protocol requests/responses MAY contain long lines and ALWAYS contain binary data (for example attribute value
707 lengths).

708 **Security considerations:**

709 IPP/1.1 protocol requests/responses do not introduce any security risks not already inherent in the underlying transport protocols.
710 Protocol mixed-version interworking rules in [ipp-mod] as well as protocol encoding rules in [ipp-pro] are complete and
711 unambiguous.

712 **Interoperability considerations:**

713 IPP/1.1 requests (generated by clients) and responses (generated by servers) MUST comply with all conformance requirements
714 imposed by the normative specifications [ipp-mod] and [ipp-pro]. Protocol encoding rules specified in [ipp-pro] are
715 comprehensive, so that interoperability between conforming implementations is guaranteed (although support for specific
716 optional features is not ensured). Both the "charset" and "natural-language" of all IPP/1.1 attribute values which are a
717 LOCALIZED-STRING are explicit within IPP protocol requests/responses (without recourse to any external information in
718 HTTP, SMTP, or other message transport headers).

719 **Published specifications:**

720 [ipp-mod] Isaacson, S., deBry, R., Hastings, T., Herriot, R., Powell, P., "Internet Printing Protocol/1.1: Model and Semantics"
721 [draft-ietf-ipp-model-v11-00.txt, February](#), [draft-ietf-ipp-model-v11-03.txt, June](#), 1999.

722 [ipp-pro] Herriot, R., Butler, S., Moore, P., Turner, R., "Internet Printing Protocol/1.1: Encoding and Transport", [draft-ietf-
723 ipp-protocol-v11-00.txt, February](#), [draft-ietf-ipp-protocol-v11-02.txt, June](#), 1999.

724 **Applications which use this media type:**

725 Internet Printing Protocol (IPP) print clients and print servers, communicating using HTTP/1.1 (see [IPP-PRO]), SMTP/ESMTP,
726 FTP, or other transport protocol. Messages of type "application/ipp" are self-contained and transport-independent, including
727 "charset" and "natural-language" context for any LOCALIZED-STRING value.

728 **Person & email address to contact for further information:**

733 Phone: 310-333-6413
734 Fax: 310-333-5514
735 Email: thastings@cp10.es.xerox.com

736 or

737 Robert Herriot
738 Xerox Corporation
739 3400 Hillview Ave., Bldg #1
740 Palo Alto, CA 94304

741 Phone: 650-813-7696
742 Fax: 650-813-6860
743 Email: robert.herriot@pahv.xerox.com

744 **Intended usage:**

745 COMMON

746 **13. Appendix D: Changes from IPP /1.0**

747 IPP/1.1 is identical to IPP/1.0 [\[RFC2565\]](#) with the follow changes:

- 748 1. Attributes values that identify a printer or job object use a new 'ipp' scheme. The 'http' and 'https' schemes are supported only
749 for backward compatibility. See section 5.
- 750 2. ~~New requirement for~~ [Clients MUST](#) support of Digest Authentication, [IPP Printers SHOULD support Digest Authentication](#).
751 See Section 6.1.17.1
- 752 3. TLS is recommended for channel security. In addition, SSL3 may be supported for backward compatibility. See Section
753 [6.1.27.2](#)

- 754 4. For interoperability with IPP/1.0, IPP/1.1 Clients SHOULD support IPP/1.0 conformance requirements. IPP/1.1 Printers
755 SHOULD support IPP/1.0 conformance requirements. See section 7.1.
- 756 5. IPP/1.1 objects SHOULD accept any request with major version number '1'. See section 7.1.
- 757 6. IPP objects SHOULD return the URL scheme requested for "job-printer-uri" and "job-uri" Job Attributes, rather than the
758 URL scheme used to create the job. See section 7.2.

759 14. Full Copyright Statement

760 The IETF takes no position regarding the validity or scope of any intellectual property or other rights that might be claimed to
761 pertain to the implementation or use of the technology described in this document or the extent to which any license under such
762 rights might or might not be available; neither does it represent that it has made any effort to identify any such rights. Information
763 on the IETF's procedures with respect to rights in standards-track and standards-related documentation can be found in BCP-
764 11[BCP-11]. Copies of claims of rights made available for publication and any assurances of licenses to be made available, or
765 the result of an attempt made to obtain a general license or permission for the use of such proprietary rights by implementers or
766 users of this specification can be obtained from the IETF Secretariat.

767 The IETF invites any interested party to bring to its attention any copyrights, patents or patent applications, or other proprietary
768 rights which may cover technology that may be required to practice this standard. Please address the information to the IETF
769 Executive Director.
